

# Software Visualization

CS 7450 - Information Visualization  
April 6, 2006  
John Stasko

# Software Visualization

- Definition

“The use of the crafts of typography, graphic design, animation, and cinematography with modern human-computer interaction and computer graphics technology to facilitate both the human understanding and effective use of computer software.”

Price, Baecker and Small, '98

# Challenge

- Software clearly is abstract data
- Unlike much information visualization, however, software is often dynamic, thus requiring our visualizations reflect the time dimension
  - History views
  - Animation
  - ...

# Subdomains

- Two main subareas of software visualization
  - Program visualization - Use of visualization to help programmers, coders, developers. Software engineering focus
  - Algorithm visualization - Use of visualization to help teach algorithms and data structures. Pedagogy focus

# Subareas

- Program Visualization
  - Software engineering
  - Debugging
  - Program analysis
  - Systems
- Algorithm Visualization
  - Pedagogy
  - Systems
  - Use in classroom
  - Empirical study

# Today's Talk

- This is a very big area, so talk will just give a flavor of the kinds of techniques and systems that have been created
  - Lots of figures
  - Some demos and videos

# Program Visualization

- Can be as simple as enhanced views of program source
- Can be as complex as views of the execution of a highly parallel program, its data structures, run-time heap, etc.

# Enhanced Code Views

Primarily used as a documentation aid

```
protected double distance(int i, int j) {
    double dx, dy;

    dx = loc[i][0] - loc[j][0];
    dy = loc[i][1] - loc[j][1];
    return Math.sqrt(dx*dx + dy*dy);
}

protected void visit(int k) {
    int t;

    now += 1;
    val[k] = now;
    for (t=0; t<n; ++t)
        if ((adj[k][t] != 0) && (val[t] == 0)) {
            dfs.Visit(t, now);
            visit(t);
            dfs.Backtrack(k);
        }
    dfs.Done(k);
}

public DFS() {
    dfs = new DFSAnimator();
    loc = new double[GraphView.MAXVERT][2];
    adj = new int[GraphView.MAXVERT][GraphView.MAXVERT];
    val = new int[GraphView.MAXVERT];
}
```

# SeeSoft System

- Pulled-back, far away view of source code
- Map one line of source to one line of pixels
  - Can indicate line indentation, etc.
- Like taping your source code to the wall, walking far away, then looking back at it

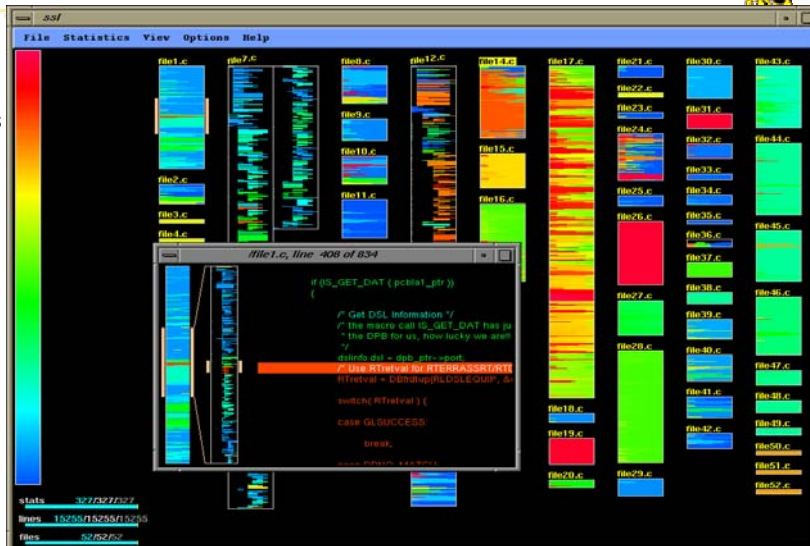

Eick, Steffen and Sumner  
IEEE ToSE '92

# System View

15,000 lines  
of code in  
52 files

Video

## Use

- Tracking (typically means mapping this data attribute to color)
  - Code modification (when, by whom)
  - Bug fixes
  - Code coverage or hotspots
- Interactive, can change color mappings, can brush views, and so on

## Tarantula

- System developed here at GT
- Utilizes SeeSoft code view methodology
- Takes results of test suite run and helps developer find program faults
- Clever color mapping is the key

# Overview

- Task is to gain insight into the software system by visualizing the evolution of changes
- Includes code organization, semantics, and attributes
- Focus on software maintenance

# Approach

- Source Code
  - CVS as version control source
  - UNIX's *diff* command to compare versions
  - Six different line status values represented
- Visualization
  - Each line of code is a pixel line
  - One file is shown at a time
  - Shows by line status, construct, or author

# Details

- File vs. Line Based

# Full Application

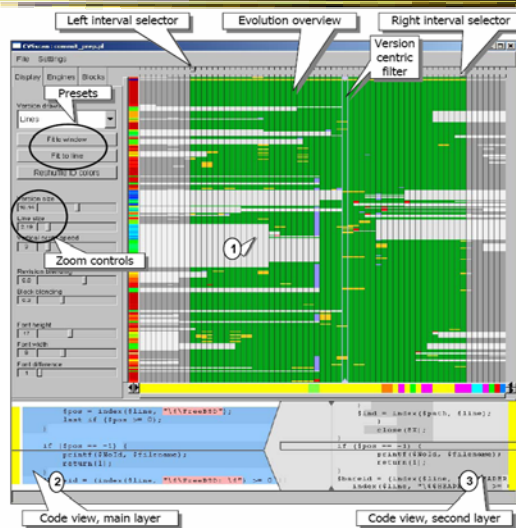

Figure 14: CVScan tool overview. The file version and line number under the mouse (1) is shown in detail in the text views (2,3)

# Conclusion

- User Studies
  - Content
  - History
- Future Work
  - Higher Level Views
  - Dependence on *diff* operator

# Stepping Up

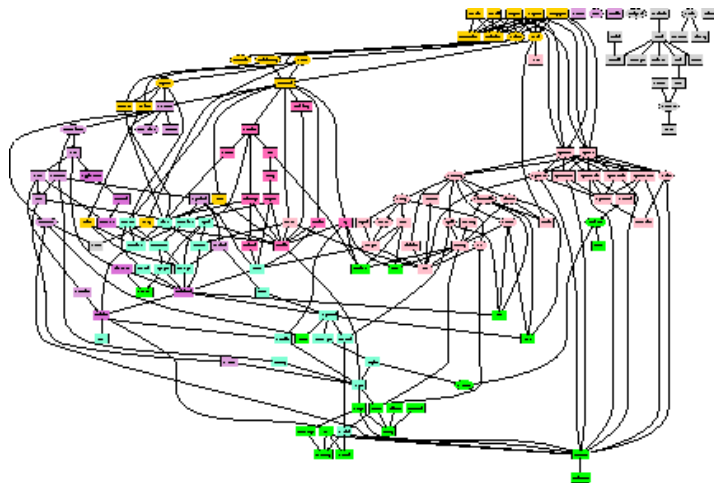

- Next step in program visualization is to help debugging and performance optimization by visualizing program executions
  - Data, data structures, run-time heap, memory, control flow, data flow, hot spots, ...

# Graph Visualization

- Area that we've already studied which is very important to SV
- Graphs pop up everywhere in software
- Common use: Visualize a call graph, visualize a flow chart, ...

# Sample CallGraph View

# FIELD

- Program development and analysis environment with a wide assortment of different program views
  - Integrated a variety of UNIX tools
  - Utilized central message server architecture in which tools communicated through message passing

Reiss  
Software Pract & Exp '90

## FIELD Interface

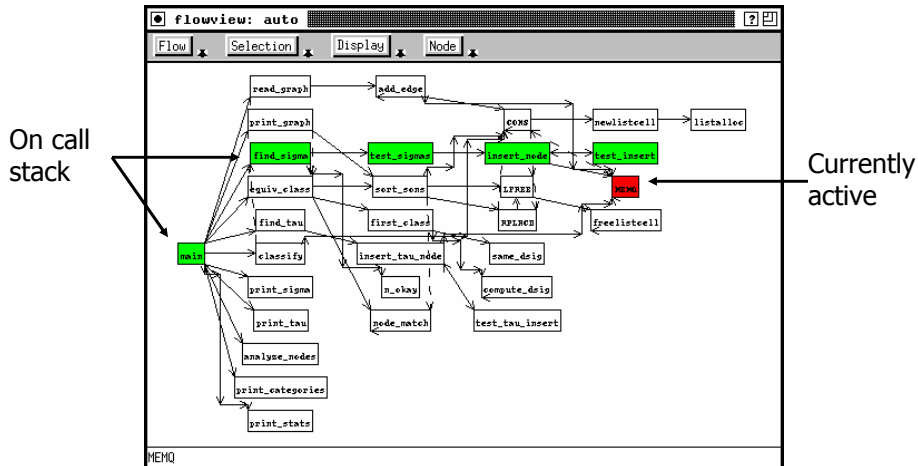

The screenshot displays the FIELD interface with several panels:

- Commands Panel:** A grid of icons for various UNIX tools like `locate`, `find`, `grep`, `diff`, `cat`, `rm`, `cp`, `mv`, `ln`, `mkdir`, `rmdir`, `chmod`, `chown`, `passwd`, `mail`, `cc`, `make`, `lpr`, `lprm`, `lpstat`, `lpq`, `lpc`, `lprc`, `lprm`, `lpstat`, `lpq`, `lpc`, `lprc`.
- Debugger Panel:** Shows execution status: `Gdb: 277 cont`, `Stoppoint (S4): Stopped at line 31 in main of file tree.c`, `31: root = insert_tree(root,j);`, `Gdb: 280 cont`, `Stoppoint (S4): Stopped at line 31 in main of file tree.c`, `31: root = insert_tree(root,j);`, `Gdb: 290`. It includes buttons for `Step`, `Next`, `Continue`, `Run`, `Stop`, `Kill`, and `Print It`.
- Flowchart Panel:** A graphical representation of the program's control flow, showing nodes and connecting arrows.
- Code Editor Panel:** Displays C code for `insert_tree` function:

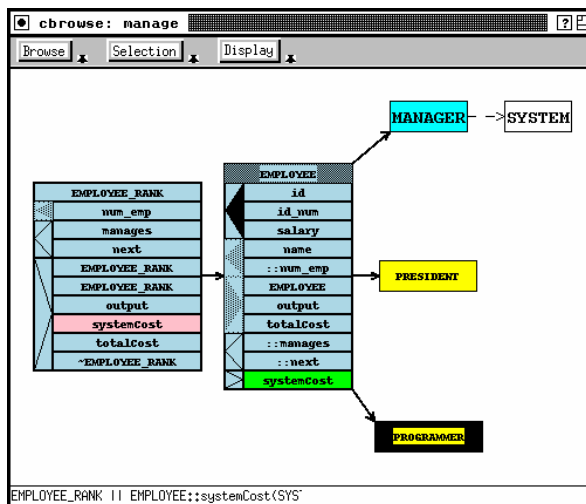

```
static TREE root;  
static TREE insert_tree();  
static void tree_init();  
  
main()  
{  
    Integer i,j,ct;  
    ct = 30;  
    root = NULL;  
    for (i = 0; i < ct; ++i) {  
        j = random() % 2000;  
        root = insert_tree(root,j);  
    }  
}
```
- Call Stack Panel:** A table showing the current call stack:

Call Name	From Name	File	Line
main()		tree.c	52
insert_tree	insert_tree	tree.c	31
main	main	tree.c	31
- Tree Diagram Panel:** A hierarchical tree structure with nodes labeled with integers like 440, 200, 900, 100, 300.
- Annotations Panel:** A panel for adding annotations to the code, with buttons for `Break`, `Update`, `Trace`, `Focus`, and `Event`.

# Paper Recap

“Strata-Variou: Multi-Layer Visualization of Dynamics in Software System Behavior”  
Kimelman, Rosenburg, Roth  
Vis '94

Angela Navarro

# Motivation

- No adequate software visualization tools
- Available tools are mostly static
- Dynamic tools present incomplete visualizations
- Significant increase of software performance

## Purpose

- PV, Program Visualization prototype
- A mechanism for exploring applications
- Visualization of software behavior over time
- Comprehensive view of the system
- Navigation across gathered data

## Goals

- Facilitate debugging by providing execution time information
- Faster assimilation of execution data
- Facilitate visual correlations, trends and anomalies
- Several layers including user-level libraries, OS and hardware

# PV

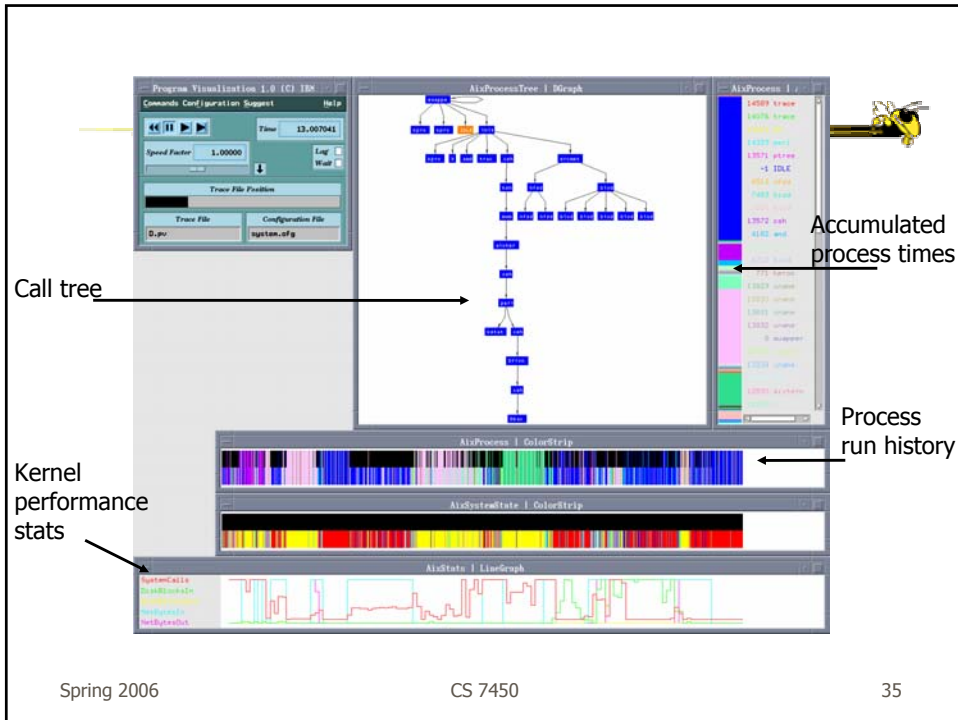

- Trace-driven
- Trace: Time ordered sequence of events of interest
- Synchronous and asynchronous configurations
- Multiple concurrent views representing the different layers

# Views

- Process scheduling and System activity
  - Scheduling view
  - Activity view

## Views

- Memory Activity and Application Progress
  - Memory size view
  - Source of memory allocation
  - State of the page of the data segment

The screenshot displays the Program Visualizer 1.0 interface. On the left, the 'Code views' section shows source code with a red line indicating the current execution point. The top right features a 'Memory view' showing a bar chart of memory usage over time. Below these are several hardware activity graphs, including 'AisProfile | @space', 'AisProcess | Golectrip', 'AisPhase | Golectrip', and 'IS2Pw | Scale | LineGraph'. A small yellow bee icon is visible in the top right corner of the interface.

Spring 2006

CS 7450

37

## Views

- Hardware Activity and Source Progress
  - Active loop view
  - Hardware performance statistics

Spring 2006

CS 7450

38

# Conclusion

- A more effective and comprehensive visualization of software
- Worthwhile for developers facing performance issues
- Room for improvement in visualization
- More direct traversal
- Presentation of derived data

# GAMMATELLA

- Extending Tarantula to show executions on larger systems
- Discuss

# Visual Technique

Figure 4 Example that illustrates the steps of the treemap node drawing.

- Segment region
- Use medians of colors
- Expand horizontally for proportion of lines in that segment
- Expand vertically for how much in that row

# Full System View

# Commercial Systems

- A number of commercial program development environments have begun to incorporate program visualization tools such as these
  - Majority are PC-based
- Has not become as wide-spread as I would have anticipated

# Concurrent Programs

- Understanding parallel programs is even more difficult than serial
- Visualization and animation seem natural for illustrating concurrency
- Temporal mapping of program execution to animation becomes critical

# POLKA

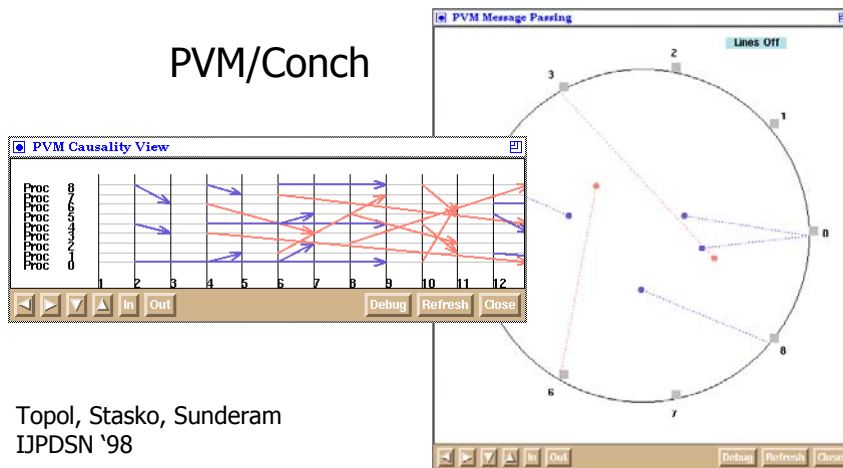

- We developed a system, POLKA, that was designed to help people build visualizations of concurrent programs
  - Used for both program and algorithm visualization
  - Used for different programming models: message passing, shared memory threads, ...

Stasko & Kraemer  
JPDC '93

# Message Passing Systems

47

# Algorithm Visualization

- Learning about algorithms is one of the most difficult things for computer science students
  - Very abstract, complex, difficult to grasp
- Idea: Can we make the data and operations of algorithms more concrete to help people understand them?

Spring 2006

CS 7450

48

# Algorithm Animation

- Common name for area
- Dynamic visualizations of the operations and data of computer algorithm as it executes
  - Abstraction is key concept

# Sorting Out Sorting

- Seminal work in area
- 30 minute video produced by Ron Baecker at Toronto in 1981
- Illustrates and compares nine sorting algorithms as they run on different data sets

# SoS Views

Video

Spring 2006

CS 7450

51

# Balsa

- First main system in area
- Used in "electronic classroom" at Brown
- Introduced use of multiple views and interesting event model

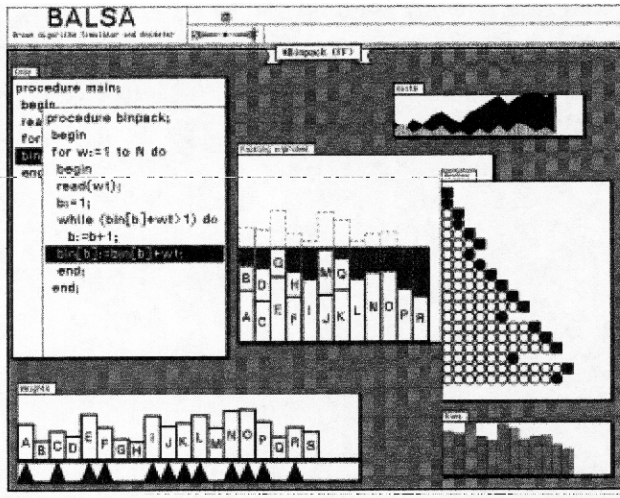

M. Brown  
Computer '88

Spring 2006

CS 7450

52

# Example Animation

Spring 2006

CS 7450

53

# Tango

- Added smooth animation to algorithm animation
- Simplification of the design/programming process (easier programming model and framework)
- Formal model of the animation, the Path-Transition Paradigm

Spring 2006

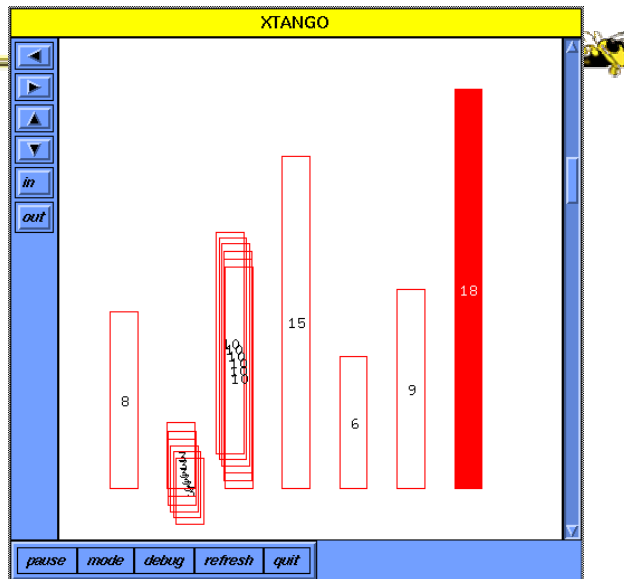

CS 7450

Stasko  
Computer '90

54

# Tango

Multiple frames from bubblesort

Spring 2006

CS 7450

55

# POLKA

- Improved animation design model
- Object-oriented paradigm
- Multiple animation windows
- Much richer visualization/animation capabilities

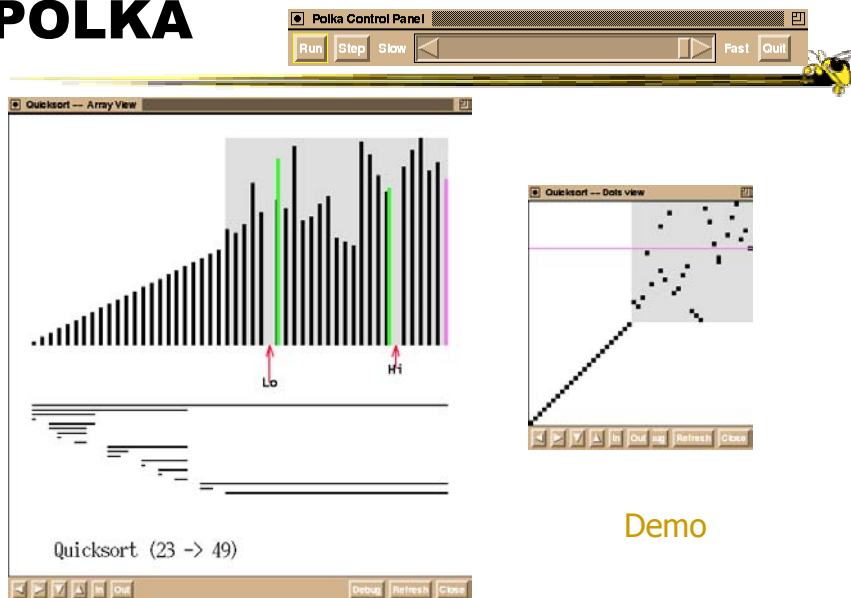

Stasko & Kraemer  
JPDC '93

Spring 2006

CS 7450

56

# POLKA

Spring 2006

CS 7450

57

## Evaluating Effectiveness

- Do algorithm animations actually help students learn?
  - That's the claim, but unproven
- Conducted a number of empirical studies to answer question
  - Compare learning with animation to learning without
  - Measuring understanding is difficult

Spring 2006

CS 7450

58

# Results

- Somewhat mixed, but some studies do show benefits
  - -> Potential for pedagogical aid is there, but just can't throw animation at algorithm and expect it to help
  - Interaction is a key
    - Blindly watching algorithm animation not really helpful
    - Student must interact with animation and be engaged
  - Animations help motivation, can make algorithm less intimidating

Hundhausen, Douglas & Stasko  
JVLC '02

# Current State of SV

- Research continues...
- Some use of algorithm animations as pedagogical aids
- Program visualization trickling into commercial tools

## What's Needed? (PV)

- Better analysis of what software developers want and need
- Flexible displays providing overview and detail
- Improved tracing/monitoring/analysis capabilities

## What's Needed? (AA)

- Focus on interactive tools
- Simpler animation construction
- Empirical validation of value

## HW 6

- Analytic scenario
- You come up with a hypothesis about what is being planned
- What kinds of visualizations might help?

## Upcoming

- Vis for Information Security
  - Guest speaker: Greg Conti
  - Reading  
Conti et al
- Animation / Image-based InfoVis
  - Papers to discuss
