Preface

This is the final volume in the present series on the Hymenoptera of Ireland. Previous catalogues dealt with the Braconidae (Ichneumonoidea) (*Occasional Publication Number 4*), the Chalcidoidea (*Occasional Publication Number 6*) and the Platygastroidea & Proctotrupoidea (*Occasional Publication Number 7*). The catalogue of the Ichneumonidae provides data on the 1135 species definitely known from Ireland, of which 222 are new to the island. The authors hope that it will stimulate interest in these remarkable insects.

The Irish Biogeographical Society is very grateful to Dr Pat Wallace (Director), Mr Ragnall Ó Floinn (Head of Collections) and Mr Nigel Monaghan (Keeper of Natural History) of the National Museum of Ireland for their interest in this work. The Society is also indebted to the National Museums and Galleries of Northern Ireland for supplying the Curtis plates and, the National Museum of Ireland for permission to reproduce the photograph of W. F. Johnson and for its sponsorship. The support of the National Parks and Wildlife Services of the Department of the Environment is greatly appreciated.

J. P. O'Connor

Abstract

The Irish ichneumonid fauna is reviewed and a checklist provided. Data are given for 1137 definite species, of which 222 are documented from Ireland for the first time.

Introduction

The superfamily Ichneumonoidea contains two families *viz.* the Braconidae and the Ichneumonidae. The Irish species of the former taxon were reviewed by O'Connor, Nash and van Achterberg (1999). This catalogue covers the Ichneumonidae which is an extremely large family with in excess of an estimated extant 60,000 species worldwide (Townes, 1969a). Over 2100 species in 35 subfamilies occur in Great Britain (Noyes *et al.*, 1999). The adults are small to very large insects, most species are fully winged (with the fore wing length 2-27mm). However, a small number are brachypterous or apterous. The antenna has 13 or usually more segments. The fore-wing venation is characteristic with the first discoidal and submarginal cells confluent and (except in one or two species) with 2m-cu present. The majority are bisexual. Adults are often seen feeding on flowers. Noyes *et al.* (1999) give a comprehensive list of references for identifying ichneumonids.

Almost all ichneumonids are parasitoids of insects or arachnids and the greatest numbers and diversity of species occur in the cool temperate areas of the world. The host range of the whole family is restricted to immature stages of endopterygote

insects, spider egg sacs, spiders themselves, and the egg nests of a pseudoscorpion. The family includes idiobionts and koinobionts. Most species develop solitarily, intimately associated, as an ecto- or endo-parasite, with a single host individual which is eventually killed. A few species develop in gregarious broods, but none is known to be polyembryonic. A small number of species, such as those which develop in spider egg sacs, consume multiple host 'individuals' and behave more like specialised predators than parasites. Some subfamilies comprise or include hyperparasites, including facultative- and pseudo-hyperparasites. Most ichneumonid species are bisexual and arrhenotokous, but a few normally are composed entirely of females and are thelytokous.

Compared to the two other immense groups of parasitic Hymenoptera, the Chalcidoidea and the Braconidae, the ichneumonids have a peculiarly limited range of hosts. Nor do they exhibit as many spectacular, bizarre and complex life-histories. Their adaptations tend to be less obvious and more subtle, but, measured in numbers of species in temperate areas, the Ichneumonidae can be considered more successful.

Host associations

Lepidoptera are the hosts of an estimated 64% of the 2000 or so British ichneumonid species, whilst a further 24% utilize Symphyta. In Britain the ratio of ichneumonid species parasitic upon Lepidoptera to Lepidoptera species is approximately 1 to 1.7, and for those parasitic on sawflies the corresponding ratio is 1 to 1.1. Probably the best known ichneumonid life history is that in which the female oviposits into or on a lepidopteran caterpillar and the resultant adult parasite emerges from the host's cocoon or pupa. Most species of the subfamilies Campopleginae, Anomaloninae, Cremastinae, Ophioninae, Banchinae, Stilbopinae, Metopiinae, Alomyinae and Lycorininae fall more or less into this category, as do many Ichneumoninae, some Tryphoninae, and a small number of Ctenopelmatinae. The members of all of these subfamilies except the Tryphoninae, and possibly the Lycorininae, develop as endoparasites. Each group exploits its lepidopterous hosts in different ways. Obvious variations include attacking hosts in particular niches (for

example, in leaf rolls or those which feed at night); oviposition into very young or into fully-grown host larvae; and killing and leaving the host before it has made its own cocoon (including, in some campoplegines, well before it is fully grown). Many ichneumonines search out hosts which have already constructed cocoons or have already pupated and this is the strategy of the members of the ectoparasitic subfamily Cryptinae and of many ecto- and endoparasitic pimelines.

Most species of Ctenopelmatinae, Adelognathinae and Tryphoninae, together with some campoplegines, attack the caterpillar-like larvae of many sawflies. The larvae of stem-sawflies (Cephalidae) are parasitized by Collyriinae, whilst the larvae of xyelids are the hosts of *Idiogramma* (Tryphoninae) and *Gelanes* (Tersilochinae). The cocoons of sawflies are attacked by cryptines, notably members of the tribe Hemigastrini. The larvae and pupae of woodwasps (Siricoidea and Xiphydriidea) are the hosts of rhysines, and a range of other groups which attack wood borers.

As well as the Symphyta, several other groups of Hymenoptera serve as hosts for ichneumonids. Orthopelmatinae parasitize cynipid larvae. A range of Cryptinae, Pimplinae, Poemeniinae, Neorhacodinae and Labeninae attack the nests of various bees, solitary wasps and social wasps. The cocoons of ichneumonids and braconids are attacked by a number of cryptines and a few pimelines, which thus act as pseudo-hyperparasites, some obligatorily. One subfamily, the Mesochorinae, comprises hyperparasites of other ichneumonids, braconids and tachinids (Diptera), with oviposition into the primary parasite larva whilst it is developing (usually internally) in (or on) the primary host. The Eucerotinae is another subfamily of specialised, obligatory hyperparasites; with an extraordinary life history involving egg-laying on the food plant of the host of the primary parasite. A few ichneumonids are cleptoparasites of other members of the family; the best known is probably *Pseudorhyssa* (Poemeniinae). A cremastine, *Temelucha interruptor*, is a facultative cleptoparasite of a braconid.

Larvae and pupae of beetles boring in wood and other plant tissue are attacked by a variety of biologically more primitive ichneumonids. Relatively few groups (often

only one or two genera in a subfamily) have exploited any of the many other Coleoptera available as potential hosts. The exception is the subfamily Tersilochinae, which parasitizes members of a wide range of beetle families. Comparatively small numbers of ichneumonids utilize Diptera as hosts, and those that do almost all belong to small, highly-specialised lineages (notably the Diplazontinae, Orthocentrinae, Cylocheriinae, Microleptinae and some groups of Cryptinae). Some Neuroptera and Mecoptera are parasitized by a few species of Cryptinae, Campopleginae and Labeninae. Trichoptera are attacked by Agriotypinae, which search for and develop on their hosts underwater, and a few Cryptinae.

Spiders succumb to ectoparasitic polysphinctines (Pimplinae), whilst their egg sacs are attacked by some other pimplines and by some cryptines. One genus of Cryptinae (*Obisiphaga*) parasitizes the egg nests of a pseudoscorpion.

Historical account

Alexander H. Haliday (1806-1870) was a meticulous entomologist from Co. Down in Northern Ireland. He made an enormous contribution to Irish Entomology (O'Connor, 1997) and his collection is preserved in the National Museum of Ireland (O'Connor and Nash, 1982). *Inter alia*, he worked on many groups of Hymenoptera including the Chalcidoidea, Ichneumonoidea, Platygastroidea and Proctotrupoidea (O'Connor, Nash and Achterberg, 1999; O'Connor, Nash and Bouček, 2000; O'Connor, Nash, Notton and Fergusson, 2004). In the Ichneumonidae, he made a very important contribution to our knowledge of the Irish fauna. Altogether, he described 45 species and 20 of these remain valid (Fitton, 1976).

William Frederick Johnson (1852-1934) was born in India. Subsequently he graduated from Trinity College Dublin and took holy orders. Like Haliday, he studied many groups and his work among the Irish insects will always stand out as a remarkable achievement (Anon., 1934). He was a careful and assiduous worker, sending dubiously identified ichneumons for verification to the Swede Per Abraham Roman. Between 1904 and 1931, he published 29 papers with new records and

PLATE 1. William Frederick Johnson (1852-1934).

observations. Many species were added to the Irish list.

Other notable workers were Claude Morley, Arthur W. Stelfox and Bryan P. Beirne. The first-named is best remembered for his contribution towards the Clare Island Survey. However, Irish ichneumonids are mentioned in another fourteen

publications including his volumes *Ichneumonologica Britannica*. Stelfox, who was employed as the entomologist in the National Museum of Ireland from 1920-1948, was one of the greatest collectors of Irish insects especially the Hymenoptera. Altogether, he published seventeen papers on the group in Ireland. B. P. Beirne studied the cephalic structures and the spiracles of the final instar larvae of the Ichneumonidae for which he was awarded a Ph.D. by Trinity College Dublin. This resulted in two important papers (Beirne, 1941a, b). Beirne's collection of microscope slides is in the Natural History Museum, London (Notton, 1995). Other important workers are cited in the references.

The present catalogue

Suprisingly, there is no previous Irish checklist for these important insects. The present catalogue provides the first comprehensive account of the Irish species, 222 of them being recorded here for the first time. Altogether, 1137 are now definitely known from the island.

This catalogue is the fourth and final one in a series (O'Connor, Nash and Achterberg, 1999; O'Connor, Nash and Bouček, 2000; O'Connor, Nash, Notton and Fergusson, 2004) which are contributions towards a checklist of the Irish Hymenoptera. In this context, the authors would be delighted to hear of any errors or omissions. Based mainly on the published literature, full data are given where available, including distributions, flight-periods and hosts. In some instances, it has been possible to give previous unpublished information gleaned from museum material when it was unavailable in the literature and these data are indicated by "(unpublished)". From specimens in NMI, it has been possible to include unpublished localities, dates of capture etc. Square brackets indicate species either removed from the Irish list, or misidentifications, while {} brackets are used for data taken from museum specimens which supplement published records. Nomenclature follows Yu and Horstmann (1997) and Schwarz and Shaw (1998, 1999). A total of 1137 species is definitely reported from Ireland, including 222 new to the fauna. This represents

approx 50 % of the number known from Britain (over 2000). Species new to the Irish fauna are indicated by an asterisk in the text. This is similar to the percentage for the Platygastroidea and Proctotrupoidea (over 52%) and higher than those of the Braconidae (44%) and Chalcidoidea (30%) (O'Connor, Nash and Achterberg, 1999; O'Connor, Nash and Bouček, 2000; O'Connor, Nash, Notton and Fergusson, 2004).

Checklists are provided for the twenty-nine subfamilies known from Ireland, and a very short description of each is given under the appropriate heading in the catalogue. However, for further information including taxonomic characters, keys and other literature, hosts and life histories, the reader should consult Gauld and Bolton (1988) and Noyes *et al.* (1999). Whenever possible, grid references for localities mentioned in the text are given in Table 1. In some instances, particularly for old records, these only indicate the general area of capture rather than a precise site. In a small number of cases, it was impossible to provide a grid reference and these are shown in italics. If authors have used vice-counties, these are cited. Nomenclature follows Yu and Horstmann (1997), Schwarz and Shaw (1998, 1999, 2000) and Shaw (2006).

ADELOGNATHINAE

The Adelognathinae comprises the single genus *Adelognathus*, which is Holarctic in distribution and includes about 45 named species. Adelognathines are generally poorly represented in collections although they occur regularly in samples from Malaise traps. Seventeen species are found in the British Isles.

It is probable that all species develop only as ectoparasites of well-grown sawfly (Hymenoptera) larvae. Gregarious parasitism has been most often observed, but at least one species seems to be solitary. The host larvae range from exposed to fully-concealed feeders, of the families Pamphiliidae and Tenthredinidae, on trees and bushes.

The broad obovoid eggs are firmly stuck by their flat bases in central dorsal positions on the abdominal segments of the host. In gregarious species the eggs are grouped and hosts bearing them are fully mobile and fit to feed. Hatching takes place within a few hours of laying and larval development is extremely rapid. The larva remains anchored by its posterior end to the collapsed egg shell until feeding is nearly completed. In some cases the host larva continues to feed until overwhelmed by the well-grown parasite larva. The rapid development may help reduce the vulnerability of these ectoparasites. The full-grown larvae leave the host and spin cocoons in cavities in ground debris or within the host retreat, if the host is a species that has one. All are thought to overwinter in the cocoon probably as a final instar larva. The summer cocoons of bivoltine species are relatively frail and pale brown while the overwintering cocoons are stout and dark brown. The adult chews an emergence hole at one side well below the apex.

KILDARE: no locality (Fitton *et al.*, 1982: p. 279).

ALOMYINAE

This subfamily comprises the ten-or-so species included in the aberrant genera *Alomya* and *Megalomya*. Some authors argue that the group belongs within the tribe Phaeogenini (then taking the name Alomyini) in the Ichneumoninae. Two species of *Alomya* occur in the British Isles.

The hosts of *Alomya* are ghost moths (Lepidoptera: Hepialidae). Males of *Alomya* are often common and conspicuous, resting on the flowers of umbellifers or flying over low vegetation. Females are much more rarely seen, spending most of the time at soil level searching for hosts. The female *A. semiflava* enters the tunnel of the final instar larva of its host *Hepialus lupulinus* (Linnaeus), approaching from the front and bringing forward her metasoma, between her legs, oviposits into the host, below and just behind its mouthparts. Females sometimes lose their antennae in these encounters with a host larva. The host larva is eventually mummified and the parasite pupates within the mummy.

Ireland (Boston and Nash, 1989: p. 136 UM).

ANOMALONINAE

This is a moderately large subfamily with over 700 species world-wide in distribution and occurring in most types of habitat. The 39 British Isles species are mainly inconspicuous, although not as rare as was once supposed.

Some members of the small tribe Anomalonini are known to parasitize the larvae of tenebrionid beetles, but as far as is known all Gravenhorstiini attack larval Lepidoptera and the recorded host range is wide, both in terms of host taxonomy and size.

Anomalonines are solitary, koinobiont endoparasites, with oviposition into an early instar larval host. Adult emergence is invariably from the host pupa. Females searching for hosts have a characteristic flight pattern, hovering and making gentle up-and-down movements close to the vegetation. The egg is placed in the haemocoel of the host, attached to an internal organ or to the body wall by means of a small holdfast. The first instar larva is reported as remaining enclosed within a membrane of embryonic origin, a trophamnion. A trophamnion is not known to occur in any other subfamily of ichneumonids. The first larval instar is the usual overwintering stage. The fully-grown larva spins only a flimsy cocoon within the host pupal shell and the adult parasite escapes by biting a roughly circular hole at the anterior end.

BANCHINAE

The Banchinae is a moderately large subfamily with about 1,500 described species.

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

All of the three currently recognized tribes, Banchini, Glyptini and Atrophini (also known as Lissonotini), are world-wide in distribution and some of the individual genera, notably *Glypta* and *Lissonota*, are very large. The British Isles fauna comprises over 110 species representing 11 genera.

All Banchinae develop as koinobiont endoparasites of Lepidoptera larvae. Oviposition is usually into a young larva but the host is not killed until it is fully-grown and has reached the prepupal stage. Banchines develop as solitary parasites, with the one known exception of a gregarious species of *Lissonota*.

The host range of the Glyptini, is restricted more or less to the Tortricoidea. Tortricoid caterpillars usually live partially concealed in leaf rolls and similar shelters. The hosts of the Atrophini comprise a wide range of mainly small Lepidoptera. Species of *Lissonota* have long ovipositors which allow them to reach concealed hosts, including wood borers, such as the goat moth *Cossus cossus* (Linnaeus) which is attacked by the particularly large species *L. setosus*. Some genera of Atrophini and the Banchini have short ovipositors and attack exposed larvae of a variety of lepidopterous groups.

All of the reliable host records for the genus *Banchus* relate to species of Noctuidae. The larvae normally develop as solitary internal parasites and it is usually suggested that oviposition is into an early instar host larva. The fully-grown *Banchus* larva kills and leaves the host larva after it has left its foodplant and entered the soil to pupate. Cocoons of *Banchus* are elongate-ovoid, the silk dense and almost black. The adult emerges through a hole cut next to one end. Most species of *Banchus* probably are univoltine and overwinter as a fully-grown larva within the cocoon. Adults are on the wing for some period during late spring or early summer. A few of the species have flight periods in very early spring and these probably pass the winter as adults, or possibly pharate adults, within the cocoon.

Atrophini

Lissonota variipes); same locality, 30 August 1909, WFJ (Johnson, 1912a: p. 78 as *Lissonota variipes*); DONEGAL: Coolmore, September 1912 and September 1915, August 1917, abundant on flowers of wild carrot *Daucus carota*, WFJ (Johnson, 1913: p. 140 as *Lissonota variipes*; Johnson, 1916a: p. 17 as *Lissonota variipes*; Johnson, 1918: p. 108 as *Lissonota variipes*. A specimen with the areolet pentagonal); same locality, sandhills and roadside, WFJ (Johnson, 1915: p. 132 as *Lissonota variipes*. I took a specimen of this common species with the head entirely flavous and another with the base of the antennae red); Portnoo, September 1917, WFJ (NMI) (Johnson, 1918: p. 108 as *Lissonota variipes*); DOWN: Dromore, August 1925, WFJ (Johnson, 1927: p. 160 as *Lissonota variipes*. ♂♀); Greencastle, ♂♀ 18 and 21 August 1930, roadside, WFJ (Johnson, 1931c: p. 140 as *Lissonota commixta*); Newcastle, ♀ August 1926, WFJ (Johnson, 1927: p. 160 as *Lissonota commixta*); Rostrevor, August 1922, WFJ (NMI) (Johnson, 1922: p. 38 as *Lissonota variipes*); same locality, ♂ 23 July 1929, mill, WFJ (Johnson, 1930: p. 157 as *Lissonota variipes*. With areolet pentagonal); LOUTH: Termonfeckin, August 1924, WFJ (NMI) (Johnson, 1927: p. 160 as *Lissonota variipes*. ♂♀).

***Lissonota (Lissonota) saturator* (Thunberg, 1824)**

synonym *Lissonota vicina* Holmgren, 1860

ARMAGH: Poyntzpass, specimen 1 April 1914, crawling on window in dining room, WFJ (Johnson, 1914b: p. 122 as *Lissonota vicina*).

Ireland (Aubert, 1978: p. 185 erroneously gives Johnson 1920 as a source).

***Lissonota (Lissonota) subaciculata* Bridgman, 1886**

ARMAGH: Poyntzpass, {15} July {1914}, in field at hogweed *Heracleum*, WFJ (NMI) (Johnson, 1915: p. 132).

***Lissonota (Lissonota) variabilis* Holmgren, 1860**

synonym *Lissonota trochanteralis* Dalla Torre, 1901

ARMAGH: Poyntzpass, {30} July {1921}, {3} August {1921}, sweeping 8.30 pm, at

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

angelica *Angelica*, WFJ (NMI) (Johnson, 1922b: p. 69); DOWN: Greencastle, ♀ {25} August 1930, common on roadside, WFJ (NMI) (Johnson, 1931c: p. 140); Newcastle, ♀♀ 25 August {1927} (NMI) and 15 September, WFJ (Johnson, 1929: p. 136); same locality, ♀♀ 6 and 16 September (NMI), 8 October, WFJ (Johnson, 1929: p. 136 as *Lissonota trochanteralis*); Rostrevor, {20} August 1922, WFJ (NMI) (Johnson, 1923: p. 38).

****Lissonota (Lissonota) versicolor* Holmgren, 1860**

New to Ireland

synonym *Lissonota formosa* Bridgman, 1888

ANTRIM: Dunseverick, ♀ 26 August 1934, RCF (NMI) (det. JFP as *Lissonota formosa*).

***Lissonota (Loxonota) cruentator* Panzer, 1809**

synonym *Lissonota insignita* Gravenhorst, 1829

MAYO: Carrowmore Lough, ♂ July 1910, CM (NMI) (Morley, 1911a: p. 12 as *Lissonota insignita*).

***Lissonota (Loxonota) histrio* (Fabricius, 1798)**

synonym *Lissonota parallela* Gravenhorst, 1829

DUBLIN: The Island, 22 July 1943 and 14 August 1945, AWS (NMI) (unpublished); MAYO: Clare Island, ♂ July 1910, CM (NMI) (Morley, 1911a: p. 12 as *Lissonota parallela*); WEXFORD: Kilmore, ♂♂♀♀ 11-13 August 1898, AB (Morley, 1908a: p. 188 as *Lissonota parallela*); WICKLOW: Buckronev, 14 August 1946, AWS (NMI) (unpublished).

Banchini

***Banchus crefeldensis* Ulbricht, 1916**

DUBLIN: The Dingle, Carrickmines, ♂♂ 23 April 1927, flying around ivy *Hedera*, AAL and AWS; KILKENNY: Graignamanagh, 29 March 1929, RAP; WICKLOW: Ballyhenry, ♂♂ 28 March 1929, over gorse *Ulex*, AAL and AWS (NMI) (conf. MGF); Glenealy {♀ 11 May 1924} (NMI) (conf. MGF); Meeting of the Waters, AAL (Stelfox, 1936: p. 63).

[*Banchus falcatorius* (Fabricius, 1775)

synonym *Banchus falcator* Fabricius, 1804

GALWAY: Roundstone, sandhills, ♀; [Kinnordy, sandhills, ♀ (not Irish)] (Morley, 1908a: p. 289 as *Banchus falcator*; Stelfox, 1936: p. 63 as *Banchus falcator*).

The Morley specimen cannot be traced in BMNH and the Irish status of *B. falcatorius* requires confirmation.]

****Banchus hastator* (Fabricius, 1793)**

New to Ireland

synonym *Banchus femoralis* Thomson, 1897

WICKLOW: Powerscourt, ♂ 19 June 1925, AWS (as *femoralis*) (USNM).

***Banchus palpalis* Ruthe, 1859**

synonym *Banchus monileatus* Gravenhorst, 1829 misidentification

DONEGAL: Kilmacrenan, July, JJK (Johnson, 1917a: p. 39 as *Banchus moniliatus* misidentification); DOWN: The White Bog, near Killough, ♂♀ 6 July 1927, on flower-heads of angelica *Angelica*, AWS (Stelfox, 1936: p. 64 as *Banchus moniliatus* misidentification); DUBLIN: Glenasmole, ♀ 14 August 1941, AWS (NMI) (det. MGF) (unpublished).

[*Banchus pictus* Fabricius, 1798

ARMAGH: Churchill, ♀, WFJ, det. CM (Johnson, 1904a: p. 256; Johnson, 1904b: p. 262; Morley, 1908a: p. 284); MAYO: Curraun district, ♂ June 1909, JNH (Morley, 1911a: p. 13; Stelfox, 1936: p. 63 but the old records for *B. pictus* are erroneous)...The two Irish records...are based on wrongly named specimens of *volutatorius* now in the National Museum).

Ireland (Aubert, 1978: p. 157).]

***Banchus volutatorius* (Linnaeus, 1758)**

synonym *Banchus monileatus* Gravenhorst, 1829

synonym *Banchus farrani* Curtis, 1836

ARMAGH: Churchill, WFJ (Johnson, 1904a: p. 256 as *Banchus pictus*; Johnson, 1904b: p. 262 as *Banchus pictus*; Morley, 1908a: p. 284 as *Banchus pictus*; Stelfox, 1936: p. 63 wrongly named specimens of *volutatorius*); Poyntzpass, July, at hogweed *Heracleum*, WFJ (Johnson, 1916a: p. 20 the female differs from the type in having the

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

head entirely black except the mouth clypeus and facial orbits, which are pale; the scutellar horn, all the coxae and the entire abdomen are also black); no locality (Stelfox, 1936: p. 63); CORK (West): no locality (Stelfox, 1936: p. 63); DONEGAL: Portnoo, ♂♀ June, bog road, WFJ (NMI) (Johnson, 1919a: p. 36); same locality, mountain road, June, WFJ (NMI) (Johnson, 1920a: p. 9; Stelfox, 1936: p. 63); DOWN: no locality {Kilkeel, ♂ 19 July 1931, AWS} (NMI) (conf. MGF) (Stelfox, 1936: p. 63); DOWN: Dundrum, ♀ 3 July 1926, WFJ (Johnson, 1927: p. 160 this specimen has the head, thorax and abdomen entirely black, hind tibiae broadly black at apex, and hind tarsi black except base of metatarsus, WFJ (Johnson, 1927: p. 160); Greencastle, ♂♀ 16 August 1930, sandhills, WFJ (NMI) (Johnson, 1931c: p. 140); Rostrevor, ♀ 7 August 1929, field opposite, WFJ (NMI) (Johnson, 1930: p. 157); Warrenpoint, ♂ 2 August, WFJ (Johnson, 1929: p. 136); DUBLIN: no locality {Slade Brook, ♀ 7 August 1935, AWS} (NMI) (conf. MGF) (Stelfox, 1936: p. 63); GALWAY: Connemara, ♂ lectotype July 1834, on the sand-hills flying around sea radish *Raphanus raphanistrum maritimus*, J. Curtis (NMV) (Curtis, 1836: 588. Ireland (Aubert, 1978: p. 55).

CAMPOPLEGINAE

This is a large and important subfamily with over 2,000 described species. It is world-wide in distribution, but is most diverse in cooler areas: the temperate regions and at high altitudes in the tropics. Many campoplegines are parasites of serious pests and several have been used in biological control programmes. Taxonomically the subfamily is a difficult and poorly studied group. Species are often difficult or impossible to separate morphologically without some prior knowledge of other aspects of their biology. It is impossible to identify easily or reliably the majority of European species and the current generic classification is not satisfactory. More than 250 species are recorded from Britain.

The overwhelming majority of species of Campopleginae develop as solitary koinobiont endoparasites of larval Lepidoptera. Within the subfamily, one characteristic, and probably advanced, life-history strategy is for oviposition into an early larval instar and for the parasite larva to complete its development before the

host larva is fully-grown. In this way these campoplegines successfully compete with the groups of parasites which attack, or at least develop in, well-grown hosts. However, it means that the campoplegine larva reaches maturity in an environment which often is much less well protected than is the case for most ichneumonids. Thus, the cocoon stage of these campoplegines exhibits a wide variety of adaptations to aid avoidance of natural enemies and other hazards. Some examples are: construction of a false cocoon, possibly to distract attention from the real thing; having the cocoon suspended at the end of a long thread; mimicry of bird droppings; spinning the cocoon within the shrivelled remains of the host; and possessing the ability to 'jump' (brought about by the final instar larva, which has a caudal appendage probably associated with this behaviour). Cocoon dimorphism is also found in campoplegines: for example, in *Bathyplectes curculionis* (Thomson) the cocoons made by overwintering, diapausing larvae are darker in colour, thicker walled, and take longer to construct than cocoons of non-diapausing larvae of the summer generation(s).

Some groups of campoplegines utilize hosts other than Lepidoptera - they have switched from caterpillars to the similarly phytophagous larvae of sawflies (Hymenoptera: 'Symphyta') and leaf beetles and weevils (Coleoptera: Chrysomelidae and Curculionidae). One lineage, comprising *Xylophylax*, *Nemeritis* and *Pyracmon*, attacks concealed larvae of beetles (Cerambycidae, Curculionidae, possibly Scolytidae, Elateridae and Armatopidae) and snake-flies (Raphidioptera), below bark and in the soil.

Campoplegines, as far as is known, always attack the host in its larval stage. Species of most genera attack older host larvae and do not complete their development until the host has constructed its cocoon. Certain species of *Campoplex* may even spin their own cocoon within the pupal shell of the host.

Although there can be considerable variation between closely related species, most individual species appear to have rather narrow host ranges, and to be physiologically well adapted to their hosts. As in many subfamilies the most obvious outward signs of adaptation are in overall size and in ovipositor structure. For instance, *Dusona* species

are relatively large and have very short ovipositors, they attack macrolepidoptera (often Geometridae) larvae on trees and shrubs, which do not conceal themselves whilst feeding. Several species of campoplegines are now known to possess a virus which the female injects into the host in the venom at oviposition. The virus particles replicate in the cells of a thickened part of the lateral oviduct, the calyx, of the female ichneumonid. It has been shown that the virus is essential for the successful development of the campoplegine larva. If the virus, the other components of the venom, or both are not injected into the host then the parasite egg or larva is encapsulated and dies. The viruses associated with campoplegines belong to the polydna-virus group and similar ones have been found in a banchine and tentatively identified in a ctenopelmatine.

O'Farrell (all Richards, 1949: p. 30 as *Nemeritis*); DUBLIN: Lucan, flour mills, ♀♀ bred August 1932 from the Mediterranean flour moth *Ephestia kühniella*, P. Roche (NMI) (det. AWS) (unpublished).

CREMASTINAE

Thirteen species, representing only four of the twenty-four known genera occur in the British Isles, where many of the species seem to be associated with warmer, drier habitats; heaths and coastal sand dunes. This moderately large subfamily, with over 650 species, is most abundant in the semi-arid tropics. Cremastines are most likely to be confused with campoplegines but can be distinguished easily by the form of the face and clypeus and the fine, longitudinal, aciculate sculpture on the second metasomal tergite.

Larval cremastines are solitary internal koinobiont parasites of lepidopterous larvae, mainly those living in concealed situations, such as leaf rolls, flower heads and tunnels and mines in plant parts. Oviposition is often into a relatively immature host larva and the egg is deposited free in the haemocoel. The host larva is killed at about the time of pupation and the fully-grown parasite larva emerges to spin its cocoon adjacent to the host remains. As with most ichneumonids the pupal stage is very short. Cremastines usually overwinter as a first instar larva within a host.

Cremastus geminus Gravenhorst, 1829

DUBLIN: Portmarnock, ♀ 3 September 1949, AWS (NMI) (det. AWS and conf. JPOC); Portrane, ♂ 2 September 1928, AWS (NMI) (det. AWS and conf. CRYPTINAE

This is the largest subfamily of the Ichneumonidae, with over 4,500 described

species. It has been one of the five traditional divisions of the family. Until recently the correct name was in dispute and it will be found referred to as Phygadeuontinae or Gelinae in much recent literature. The host associations of the subfamily cover a greater taxonomic range than the rest of the family together and numbers of species occur in every type of terrestrial habitat. More than 450 species representing over 80 genera are currently recorded from the British Isles.

The majority of species are easily recognized as belonging to the subfamily although some of the medium- and larger-sized species might be confused with the Ichneumoninae. More recognition problems are likely to arise with some small species, especially the males, which tend to have a rather non-descript appearance. Although the limits of this subfamily have remained rather stable, its tribal and generic classification has undergone, and is still undergoing, considerable change.

Like the other large subfamily of idiobiont ectoparasitoids, the Pimplinae, the Cryptinae has a very wide host range. However, cryptines show marked host-specificity, in contrast to the niche-specificity of pimplines. Like koinobiont endoparasitoid ichneumonids, individual species often have very narrow host ranges but, unlike them, this seems to be the culmination of a process of morphological rather than physiological, adaptation. Relatively few species function as facultative hyperparasites and the kind of hyperparasitism which occurs most widely in the Cryptinae is pseudohyperparasitism.

Although the vast majority of species are idiobiont ectoparasitoids, there have been changes in a few lineages. The genera of the subtribe Stilpnina, seem to be koinobiont endoparasitoids of Diptera, ovipositing into the larva (see below). Larvae of *Blapsidotes vicinus* develop endophagously in gregarious broods in the naked pupae of butterflies and some species of *Goryphus* and *Cryptus* appear to be endophagous in lepidopterous pupae. The typical strategy, however, is to attack a host in a protected situation, most often a prepupa or pupa in a cocoon, but sometimes larvae in similar structures and hosts in other concealed situations. For example, many species of *Phygadeuon* are ectoparasites of the pupae of Diptera within puparia and various

genera of Cryptini attack nests of bees and wasps. In such nests the larva of at least one species of *Aritranis* is known to consume the contents of more than one cell during its development. A few genera are parasites in the nests of social wasps (Vespidae). One such species, *Sphécophaga vesparum* (Curtis), is a gregarious parasite on the pupae of Vespinae and has been used in attempts to control perennial colonies of social wasps in New Zealand. Spider egg sacs serve as 'hosts' for the species of a number of genera, some of which are composed entirely of such species (for example, *Trychosis*, *Hemiteles*), while others belong to genera which attack a range of cocoon-like structures (for example, *Gelis*, *Bathythrix*). Although the use of spider egg cocoons as hosts seems to have evolved several times, only one ichneumonid, the african phygadeuontine *Sozites kerichoensis* Kerrich, is known to attack the egg masses of an insect - those of the weevil *Entypotrachelus meyeri* Kolbe (Coleoptera: Curculionidae). The genus *Obisiphaga* is exceptional in that it utilizes the egg nests of a pseudoscorpion.

The biology of the genera comprising the subtribe Stilpnina is atypical, but of particular interest because probably all species are koinobiont endoparasitoids. The most reliable and complete account relates to an unidentified species of *Mesoleptus* parasitising *Sarcophaga nigriventris* Meigen (Diptera: Sarcophagidae) feeding in dead snails (*Cepaea nemoralis* (Linnaeus)). The female *Mesoleptus* searches for and detects the larvae of the fly by probing the decaying body of the snail with her ovipositor. The antennae are not used at this stage and neither are the tarsi important, as females were frequently observed to stand on a host without apparently detecting it. The larva may attempt to escape parasitisation by wriggling movements when touched by the ovipositor, and its thick cuticle is not easily pierced. Fairly mature fly larvae are used for oviposition and they continue to develop normally and to form a puparium (which is of a similar size to those formed by unparasitised larvae). The parasite larva pupates within the host puparium and the adult *Mesoleptus* escapes by biting its way out at the anterior end. The species is always a solitary parasite. Another interesting fact is that this particular *Mesoleptus* species does not attack two other species of *Sarcophaga*

found in the dead *C. nemoralis*, even when they were present in the same snail as *S. nigriventris*.

Cryptini

***Acroricnus stylator* (Thunberg, 1824)**

synonym *Acroricnus macrobatus* (Gravenhorst, 1829)

CLARE: Poulsallagh, ♀ 8 July 1927, AWS (NMI) (det. AWS as *Acroricnus macrobatus*) (Stelfox, 1927: p. 324 as *Acroricnus macrobatus*. I have several times taken the ichneumon...in places where this wasp [*Ancistrocerus pictus* Curtis] nested.); GALWAY: Furnace (Foirnís) Island, Lettermullan, ♂♀ 17 July 1997, from *Ancistrocerus scoticus* (Curtis) (Hymenoptera: Eumenidae) nest on a rock face in a field across the road, COR (det. MRS) (NMI) (unpublished); also ♂ emerged 12 July 2001 and ♂ emerged 15 July 2001, COR (Ronayne and O'Connor, 2006: pp 38-39); KERRY (V.C. H2): Dingle, ♀ 5 July 1977, C. P. J. Ash (RSM) (Schwarz and Shaw, 1998: p. 124); WATERFORD: Stradbally, ♀ 22-30 June 1907, HWA (Morley, 1908b: p. 276 as *Acroricnus macrobatus*. One very small specimen of only 10mm in length; Morley, 1914: p. 171 as *Acroricnus macrobatus*); WICKLOW: Rathdrum, ♀ 8 July 1927, AWS (NMI) (det. AWS as *Acroricnus macrobatus*) (unpublished).

Ireland (Yu, 1998: CD-Rom).

***Agrothereutes abbreviatus* (Fabricius, 1794)**

ANTRIM: Killead, ♂ August 1923, WFJ (NMI) (Johnson, 1927: p. 159 as *Spilocryptus abbreviator*); ARMAGH: Poyntzpass, August and September 1916, in field and on roadside, WFJ (NMI) (Johnson, 1917a: p. 38 as *Spilocryptus abbreviator*; Johnson, 1921a: p. 106 as *Spilocryptus abbreviator* var. *hopei* Gravenhorst); CAVAN (V.C. H30): no locality (RSM) (Schwarz and Shaw, 1998: p. 109 as f. *incubitor* (Gravenhorst, 1829)); DONEGAL: Coolmore, ♂ {28 September 1916}, among willows *Salix*, WFJ (NMI) (Johnson, 1915: p. 131 as *Spilocryptus abbreviator*); same locality, ♀ September 1916, roadside, WFJ (Johnson, 1917a: p. 38 var. *hopei*); Portnoo, ♀ September 1917, among herbage on roadside, WFJ (NMI) (Johnson, 1918: p. 108 as *Spilocryptus abbreviator*); same locality, September, cliff, WFJ (Johnson,

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

1919a: p.36 as *Spilocryptus abbreviator* var. *hopei* Gravenhorst); DOWN: Rostrevor, ♂ 23 July, WFJ (Johnson, 1929 as *Spilocryptus abbreviator*); same locality, ♂ 7 August 1929, field opposite, WFJ (Johnson, 1930: p. 157 as *Spilocryptus abbreviator*); MAYO: Clare Island, ♀ September 1910, WFJ (Morley, 1911a: p. 11 as *Spilocryptus abbreviator*).

***Agrothereutes adustus* (Gravenhorst, 1829)**

synonym *Spilocryptus nubeculatus* (Gravenhorst, 1829)

DOWN: Newcastle, ♀ July, JJK (Johnson, 1918: p. 108 as *Spilocryptus nubeculatus*); Rostrevor, ♀ 9 July {1927}, WFJ (NMI) (Johnson, 1929: p. 136 as *Spilocryptus nubeculatus*).

***Agrothereutes leucorhaeus* (Donovan, 1810)**

synonym *Agrothereutes tibialis* (Thomson, 1873)

DOWN: Rostrevor, ♀ 27 July 1929, grass plot, WFJ (NMI) (Johnson, 1930: p. 157 as *Spilocryptus tibialis*).

****Agrothereutes mandator* (Linnaeus, 1758)**

New to Ireland

synonym *Spilocryptus cimbicis* (Tschek, 1871)

WICKLOW: Prince William's Seat, ♂♂♀♀ emerged June 1927 from a cocoon of the emperor moth *Saturnia pavonia* (L.) (Lepidoptera: Saturniidae) collected in January 1927, WFJ Collection (NMI) (det. AR as *Spilocryptus cimbicis*).

[*Agrothereutes mansuetor* (Tschek, 1871)

ARMAGH: Poyntzpass, ♀ June, in garden, WFJ (Johnson, 1918: p. 108 as *Spilocryptus*).

The specimen is actually *Pycnocryptus director* (now *Aritranis*) (Johnson, 1919a: p. 34 as *Pycnocryptus peregrinator*).]

***Agrothereutes saturniae* (Boie, 1855)**

ANTRIM/DOWN: Belfast, 2♂♂2♀♀ June 1927, D. J. Carpenter (Nicholson, 1933: p. 109 as *Spilocryptus*).

***Aritranis director* (Thunberg, 1824)**

synonym *Aritranis peregrinator* misidentified

ANTRIM: Killead, August 1923, WFJ (NMI) (Johnson, 1927: p. 159 as *Pycnocyrtus peregrinator*. ♂♀); ARMAGH: Poyntzpass hill, June, WFJ (Johnson, 1914a: p. 65 as *Pycnocyrtus peregrinator*); Poyntzpass, ♀ June, in garden, WFJ (NMI) (Johnson, 1918: p. 108 as *Spilocyrtus mansuetor*; Johnson, 1919a: p. 34 the record of *S. mansuetor* corrected to *P. peregrinator*); same locality, June and July, fields, WFJ (Johnson, 1919a: p. 36 as *Pycnocyrtus peregrinator*); DONEGAL: Portnoo shore, {10} June {1919}, WFJ (NMI) (Johnson, 1920a: p. 9 as *Pycnocyrtus peregrinator*... and var. *analys* Gravenhorst); DOWN: Dundrum, June 1926, WFJ (Johnson, 1927: p. 159 as *Pycnocyrtus peregrinator*. ♂♀); Newcastle, ♂ August, JJK (Johnson, 1918: p. 108 as *Pycnocyrtus peregrinator* var. *analys* Gravenhorst); same locality, ♂ 5 September, WFJ (Johnson, 1929: p. 136 as *Pycnocyrtus peregrinator*); Rostrevor, May and June 1923, WFJ (NMI); same locality, ♂ June 1924, var. *analys* Gravenhorst, WFJ (both Johnson, 1927: p. 159 as *Pycnocyrtus peregrinator*. ♂♀); Warrenpoint, ♂ 13 September, WFJ (Johnson, 1929: p. 136 as *Pycnocyrtus peregrinator*); KERRY: no locality, ♀♀ (Morley, 1907a: p. 269 as *Pycnocyrtus peregrinator*); LOUTH: Carlingford, June 1921, WFJ (NMI) (Johnson, 1922a: p. 17 as *Pycnocyrtus peregrinator* and var. *analys* Gravenhorst); Termonfeckin, August 1924, WFJ (NMI) (Johnson, 1927: p. 159 as *Pycnocyrtus peregrinator*); MAYO: Achill Sound, ♂ {June 1910}, WFJ (NMI); Clare Island, ♀ {July 1910}, CM (NMI) (Morley, 1911a: p. 11 as *Pycnocyrtus peregrinator* Linnaeus).

***Buathra tarsoleucos* (Schrank, 1781)**

GALWAY: Ross, ♂ September 1905, JNH (Morley, 1911c: p. 20 as *Cryptus*; Anon., 1913: p. 43 as *Cryptus*); KILDARE: ♂ 5 May 1940, AWS (NMI) (det. AWS) (unpublished).

***Cryptus armator* Fabricius, 1804**

synonym *Cryptus albatorius* misidentified

ANTRIM: Belfast, June 1909, HLO (NMI) (Johnson, 1915: p. 131 as *Cryptus albatorius*); ARMAGH: Poyntzpas, field, May, WFJ (Johnson, 1921a: p. 106 as *Cryptus albatorius* var. *titubator* Thunberg); LOUTH: Carlingford, June 1921, WFJ

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

(Johnson, 1922a: p. 17 as *Cryptus albatorius* var. *titubator*); Termonfeckin, ♀♀ August 1924, WFJ (NMI) (Johnson, 1927: p. 159 as *Cryptus albatorius teste* Roman, also var. *titubator (infumatus* Thomson)).

***Cryptus diana* Gravenhorst, 1829**

ARMAGH: Poyntzpass, August 1916, in fields, WFJ (Johnson, 1917a: p. 39); Poyntzpass hill, May, WFJ (NMI) (Johnson, 1920a: p. 9); DONEGAL: Portnoo shore, {18} June {1919}, WFJ (NMI) (Johnson, 1920a: p. 9); DOWN: Dundrum, ♂ June 1926, WFJ (NMI) (Johnson, 1927: p. 159); Rostrevor, ♂ 9 July 1930, field opposite, WFJ (NMI) (Johnson, 1931a: p. 54).

***Cryptus fibulatus* Gravenhorst, 1829**

CARLOW: Kilcarr, ♂ 14 August 1930, AWS (NMI) (det. AWS) (unpublished); DONEGAL (V.C. H34): Bundoran, ♀ 30 September 1946, RCF (RSM) (Schwarz and Shaw, 1998: p. 120); WICKLOW: The Murrough, ♀ 19 September 1926, AWS (NMI) (det. AWS) (unpublished).

***Cryptus inculcator* (Linnaeus, 1758)**

synonym *Cryptus sponsor* (Fabricius, 1793)

ANTRIM: Cave Hill, near Belfast, HLO (NMI) (Johnson, 1913: p. 139).

***Cryptus minator* Gravenhorst, 1829**

ARMAGH: Poyntzpass, {22} July {1912}, in one of my fields, WFJ (NMI) (Johnson, 1913: p. 139); DONEGAL: Coolmore, August 1917, among sallows *Salix*, WFJ (NMI) (Johnson, 1918: p. 108).

***Cryptus moschator* (Fabricius, 1787)**

DOWN: Dromore, ♂♀ August 1925, many at gooseberry *Ribes* bushes, WFJ (NMI) (Johnson, 1927: p. 159); Rostrevor, ♂ 13 July 1929, grass plot, ♂ 23 July 1929, mill, WFJ (NMI); same locality, Victoria Square, ♂ 6 September 1929, WFJ (all Johnson, 1930: p. 157).

****Cryptus spinosus* Gravenhorst, 1829**

New to Ireland

MAYO: Mulranny, 13 July 1889 (NMI).

***Cryptus titubator* (Gravenhorst, 1822)**

DONEGAL: Portnoo, ♂ June, among willows *Salix* on the roadside, WFJ (NMI) (Johnson, 1920b: p. 19); DOWN: Greencastle, ♀ 21 August 1930, roadside, WFJ (NMI) (Johnson, 1931c: p. 140).

***Cryptus tuberculatus* Gravenhorst, 1829**

ARMAGH: Poyntzpass, ♀ July 1906, WFJ (NMI) (Morley, 1907b: p. 160; Johnson, 1912a: p. 78).

***Cryptus viduatorius* Fabricius, 1804**

DOWN: Greencastle, ♀♀ 5 and 6 August 1930, shore near pier, WFJ (NMI) (Johnson, 1931c: p. 140); Newcastle, August, JJK (Johnson, 1918: p. 108); LOUTH: Termonfeckin, ♀ August 1924, WFJ (NMI) (Johnson, 1927: p. 159); WICKLOW (V.C. H20): no locality (RSM) (Schwarz and Shaw, 1998: p. 121).

Ireland (Yu, 1998: CD-Rom).

***Gambrus bipunctatus* (Tschek, 1872)**

Gambrus ornatus (Gravenhorst, 1829) misidentification

KERRY: Parknasilla, 2♀♀ emerged 4 and 7 August from a burnet *Zygaena ?filipendulae* (Lepidoptera: Zygaenidae) puparium taken 15 July, JWY (Morley, 1902: pp 54-55 as *Spilocryptus ornatus*; Morley, 1907a: p. 285 as *Gambrus ornatus*).

***Gambrus incubitor* (Linnaeus, 1758)**

ARMAGH: Richhill, ♀ 10 August 1909, HLO; Poyntzpass, WFJ (NMI) (Johnson, 1912a: p. 78 as *Spilocryptus*).

***Gambrus ornatulus* (Thomson, 1873)**

DOWN: Greencastle, ♀ 22 August 1930, sandhills, WFJ (Johnson, 1931c: p. 140).

***Gambrus ornatus* (Gravenhorst, 1829)**

Ireland (Broad, 2006: Validity as an Irish species confirmed by a specimen (coll. A. Anderson) identified by M. Schwarz. The species referred to as *ornatus* in older literature is now known as *bipunctatus* (Schwarz and Shaw, 1998).

***Gambrus superus* (Thomson, 1896)**

DOWN: Greencastle, ♂ 22 August 1930, sandhills, WFJ (NMI) (Johnson, 1931c: p. 139).

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

***Hidryta sordida* (Tschek, 1871)**

CAVAN: Sloan's Fort, Cornafean, 30 June 1934, RCF (BMNH) (det. M. Schwarz) (unpublished); LAOIS (V.C. H14): no locality (RSM) (Schwarz and Shaw, 1998: p. 114).

Ireland (Yu, 1998: CD-Rom).

****Hoplocryptus bellosus* (Curtis, 1837)**

New to Ireland

WEXFORD: The Raven, ♂ emerged 18 June 2000 ex trap nest of *Ancistrocerus* (Hymenoptera: Eumenidae), ♀♀ emerged 21 June 2000, 4 July 2000 and 9 July 2000 ex traps nest of *Hylaeus confusus* Nylander (Hymenoptera: Colletidae) on sand dunes/*Pinus* wood, COR (det. MRS as *Aritranis bellosa*) (NMI); WICKLOW: The Devil's Glen Wood, ♀♀ emerged 9 and 14 June 1999 ex trap nest, COR (det. MRS as *Aritranis bellosa*) (NMI) (all unpublished).

***Idiolipsa analis* (Gravenhorst, 1807)**

ARMAGH: Poyntzpass, July, field, WFJ (NMI) (Johnson, 1919a: p. 36); Poyntzpass hill, July, WFJ (Johnson, 1920a: p. 9); CORK: Glengariff, JWY; KERRY: Kenmare, JWY (both Morley, 1902: p. 55 as *Liocryptus*. 3♂♀ 19-30 June 1901); Waterville, June, JWY (Morley, 1907a: p. 297); LOUTH: Termonfeckin, ♂♀ August 1924, WFJ (NMI) (Johnson, 1927: p. 159); MAYO: Achill Sound, {June 1910}, WFJ (NMI); Belclare, {♂♀ July 1910}, JNH (NMI); Old Head Woods, {Louisburgh, ♂ 13 July 1910}, CM (NMI) (Morley, 1911a: p. 11 not uncommon).

***Idiolipsa obfuscator* (Villers, 1789)**

ARMAGH: Poyntzpass, Acton Wood, June, rare, WFJ (NMI) (Johnson, 1916a: p. 20 as *Idiolipsa*).

****Ischnus agitator* (Olivier, 1792)**

New to Ireland

synonym *Ischnus minutorius* (Fabricius, 1804)

KERRY: Ardagh, Killarney, 28 April 1931, EFB (NMI); TIPPERARY: Aherlow, 13 and 23 September 1943, AWS (NMI); Flesk, Killarney, 14 July 1943, edge of field, BPB (NMI) (all as *minutorius*).

***Ischnus alternator* (Gravenhorst, 1829)**

DOWN: Rostrevor, ♂ 26 July 1930, in field opposite, WFJ (NMI) (Johnson, 1931a: p. 54 as *Habrocryptus*); MAYO: Clare Island, ♀ 1909, on the cliffs, JNH (NMI) (Morley, 1911a: p. 12 as *Habrocryptus*).

***Ischnus inquisitorius* (Müller, 1776)**

synonym *Ischnus porrectorius* (Fabricius, 1787)

synonym *Ischnus migrator sensu* Gravenhorst misidentification

ANTRIM: Cave Hill, ♀, HLO (NMI) (Johnson, 1912a: p. 78 as *Habrocryptus porrectorius*); Garfield Street, Belfast, ♂♀, HLO (NMI) (Johnson, 1912a: p. 78 as *Spilocryptus migrator*); ARMAGH: Poyntzpass, August 1916, in fields, WFJ (NMI) (Johnson, 1917a: p. 38 as *Spilocryptus migrator*); DONEGAL: Portnoo, June, WFJ (Johnson, 1919a: p. 36 as *Spilocryptus migrator*); DOWN: Rostrevor, ♂ June 1924, WFJ (Johnson, 1927: p. 159 as *Spilocryptus migrator*); FERMANAGH: Tempo, bred from the emperor moth *Saturnia pavonia* (L.) (Lepidoptera: Saturniidae), CL (Johnson, 1919a: p. 36 as *Spilocryptus migrator*); KERRY: Rossbeigh, August, LHBW (Johnson, 1913: p. 13 *Spilocryptus migrator* var. *brevipennis* Desv.).

***Meringopus titillator* (Linnaeus, 1758)**

ARMAGH: Poyntzpass, July and August 1916, in fields, WFJ (Johnson, 1917a: p. 39 as *Goniocryptus*); CORK: Glengarriff, ♂ 27 June 1901, JWY (Morley, 1902: p. 55 as *Goniocryptus*. ?var. *tarsis posticis* ... *totis nigris*; Morley, 1907a: p. 300 as *Goniocryptus*); DOWN: Rostrevor, August 1922, WFJ (Johnson, 1923: p. 38 as *Goniocryptus*); KERRY: ?Kenmare (Kennan) (Morley, 1907a: p. 300 as *Goniocryptus*); Waterville, ♀ 27 July 1901, JWY (Morley, 1902: p. 55 as *Goniocryptus*; Morley, 1907a: p. 300 as *Goniocryptus*); MAYO: Belclare, JNH; Sraheens Lough, WFJ (Morley, 1911a: p. 12 as *Goniocryptus*)

***Mesostenus transfuga* Gravenhorst, 1829**

DONEGAL: Coolmore, ♀ {10} September 1912, WFJ (NMI)(Johnson, 1913: p. 139).

***Sphecophaga vesparum* (Curtis, 1828)**

DOWN: Newcastle, ♀ 11 (ii) June {1927}, WFJ (NMI) (Johnson, 1929: p. 137); WICKLOW: Altidore, ♀ 26 June 1929, AWS (NMI) (det. AWS); Clara, ♀ 5 July

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

1925, AWS (NMI) (det. AWS); Powerscourt, ♀ 24 May 1928, AWS (NMI) (det. AWS) (all unpublished).

****Thrybius praedator* (Rossi, 1792)**

New to Ireland

synonym *Thrybius leucopygus* (Gravenhorst, 1829)

WEXFORD: Curracloe, ♂ 17 July 1937, AWS (NMI) (det. GJK as *Thrybius leucopygus*); WICKLOW: Murrough, ♀ 13 June 1948, AWS (NMI) (det. AWS as *Thrybius leucopygus*).

***Thrybius tricolor* (Gravenhorst, 1829)**

DOWN: Rostrevor, ♂ 23 July {1927}, WFJ (NMI) (Johnson, 1929: p. 136 as *Gambrus*).

***Trychosis legator* (Thunberg, 1824)**

synonym *Goniocryptus clypearis* Thomson, 1873

synonym *Trychosis plebeja* (Tschek, 1871)

DOWN: Dundrum, ♀ {3} August 1926, WFJ (NMI) (Johnson, 1927: p. 159 as *Goniocryptus plebejus*); DUBLIN (V.C. H21): no locality (RSM) (Schwarz and Shaw, 1998: p. 116); KERRY: Waterville, ♂ 30 July 1901, JWY (Morley, 1902: p. 55 as *Goniocryptus clypearis*; Morley, 1907a: p.310 as *Goniocryptus plebejus*); LOUTH: Carlingford, June 1921, WFJ (NMI) (Johnson, 1922a: p.17 as *Goniocryptus plebejus*); WICKLOW (V.C. H20): no locality, (RSM) (Schwarz and Shaw, 1998: p. 116).

Ireland (Yu, 1998: CD-Rom).

Hemigastrini

****Aconias tarsatus* (Bridgman, 1881)**

New to Ireland

KERRY: Killarney, September 1922, July and August 1923, August 1924, August 1926, September 1927, September 1928 and 6 September 1930, EFB (NMI); WICKLOW: Cloghleagh, 9 August 1931, AWS (NMI).

***Aptesis assimilis* (Gravenhorst, 1829)**

synonym *Microcryptus distans* Thomson, 1883

DOWN: Rostrevor, ♂♂ 5 and 26 July 1930, field opposite, WFJ (Johnson, 1931a: pp 53-54 as *Microcryptus distans*); same locality, ♂ 9 July {1927}, WFJ (NMI); LOUTH:

Ireland (Haliday, 1839: p. 118 not common; Fitton, 1976: p. 332 syntypes...lost. Identity. Unknown, the name remains a *nomen dubium*); Jussila, 1979a: p. 42 syntypes ♂♀: Ireland and England, specimens lost.]

***Bathythrix aerea* (Gravenhorst, 1829)**

MAYO: Brackloon Wood, Westport, ♂ August, PEG (Morley, 1911a: p. 11 as *Panargyrops*).

***Bathythrix claviger* (Taschenberg, 1865)**

DOWN: Newcastle, ♂ 13 May, WFJ (NMI) (Johnson, 1929: p. 136 as *Leptocryptus*

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

(*Panargyrops*)).

***Bathythrix decipiens* (Gravenhorst, 1829)**

FERMANAGH: Carrickcreagh, ♀ 23 September 1939, PE (RCF collection) (BMNH);

KILDARE: west of Leixlip, ♂ 16 August 1942, AWS (BMNH) (Sawoniewicz, 1980: p. 337).

****Bathythrix lamina* (Thomson, 1884) New to Ireland**

DUBLIN: Saggart, ♀ 29 September 1935, AWS (NMI) (det. G. J. Kerrich);

WICKLOW: Ballyhubbock, ♀ 14 May 1937, AWS (NMI) (det. G. J. Kerrich).

****Bathythrix pellucidator* (Gravenhorst, 1829) New to Ireland**

DUBLIN: Lucan, ♂ 5 August 1943, AWS (NMI) (det. G. J. Kerrich); TIPPERARY:

Aherlow, ♂ 13 September 1943, AWS (NMI) (det. G. J. Kerrich).

***Bathythrix prominens* (Strobl, 1901)**

DUBLIN: Glenasmole, ♀♀ September 1937, AWS (BMNH); KILDARE: Kilkea

Park, ♀♀ September 1937, AWS (BMNH) (Sawoniewicz, 1980:p. 352).

***Bathythrix rugulosa* (Thomson, 1884)**

Ireland (Sawoniewicz, 1980: p. 331).

***Bathythrix thomsoni* (Kerrich, 1942)**

Ireland (Jussila, 1986: p. 125 Eire).

***Blapsidotes vicinus* (Gravenhorst, 1829)**

synonym *Hemiteles melanarius* Gravenhorst, 1829

CORK: Glengarriff, ♂♀♀ emerged 29 July 1943 from pupa of a red admiral *Vanessa atalanta* (L.) (Lepidoptera: Nymphalidae), J. E. Flynn (NMI) (det. AWS as *Hemiteles melanarius*) (unpublished);

DOWN: Newcastle, ♀ 3 September 1929, in window,

WFJ (NMI) (Johnson, 1930: p. 157 as *Astomaspis (Hemiteles) melanarius*. Var. (*fide*

Dr A. Roman) legs entirely red (*rufipes* Strobl)).

***Charitopes areolaris* (Thomson 1884)**

WICKLOW: no locality, 16 August 1943, BPB (Townes, 1983: p. 59 as *Charitopes areolaris areolaris*).

***Charitopes clausus* (Thomson, 1888)**

WICKLOW: no locality (Townes, 1983: p. 54).

***Charitopes gastricus* (Holmgren, 1868)**

DUBLIN: Glenasmole; MEATH: Agher {♀ 29 August 1937, AWS (BMNH)};

LEITRIM: Tullaghan (as Tullagham) {♀♀ October 1937, AWS (BMNH)};

WICKLOW: no locality (Townes, 1983: p. 67).

****Cremnodes atricapillus* (Gravenhorst, 1815) New to Ireland**

DUBLIN: Glenasmole, 25 August 1937, AWS (NMI); Phoenix Pk (Park), 18 July 1945, AWS (NMI); WICKLOW: Ballinlea, 28 July 1940, AWS (NMI); Blessington, 19 June 1938, AWS (NMI); Glending, 16 September 1953, AWS (NMI).

Ireland: Haliday (NMI).

***Diaglyptidea conformis* (Gmelin, 1790)**

DONEGAL: Coolmore, September 1916, in porch of bungalow, WFJ (NMI) (Johnson, 1917a: p. 38 as *Hemiteles*); WICKLOW: Glenasmole, ♂ 6 October 1938, AWS (NMI) (det. JFP) (unpublished).

***Dichrogaster aestivalis* (Gravenhorst, 1829)**

DUBLIN: Glenasmole, {♀ 25 May 1937, AWS (BMNH) (det. HKT)}; KILDARE: Kilkea Park, {♀ September 1937, AWS (BMNH) (det. HKT)} (Townes, 1983: p. 119).

***Dichrogaster genalis* (Habermehl, 1925)**

WICKLOW: no locality, 22 August 1940, BPB (Townes, 1983: p. 92).

Ireland (Schwarz and Shaw, 2000: p. 180)

***Dichrogaster liostylus* (Thomson, 1885)**

DOWN: Rostrevor, ♀ 31 May 1930, in garden, WFJ (Johnson, 1931a: p. 53 as *Hemiteles*); KERRY: no locality, 2 August 1940 and 16 July 1943, BPB (Townes, 1983: p. 100).

***Encrateola laevigata* (Ratzeburg, 1848)**

DOWN: Dromore, ♀ August 1925, WFJ (NMI) (Johnson, 1927: p. 159 as *Hemiteles*);

Newcastle, ♀ 27 August, WFJ (NMI) (Johnson, 1929: p. 136 as *Hemiteles*).

***Endasys brevis* (Gravenhorst, 1829)**

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

ARMAGH: Poyntzpass, August, in fields, WFJ; DONEGAL: Coolmore, {17} September {1913}, at Umbelliferae, WFJ (NMI) (Johnson, 1914a: p. 65 as *Glyphicnemis*); same locality, September, on flowers of Umbelliferae, WFJ (Johnson, 1916a: p. 20 as *Glyphicnemis*); DOWN: Dundrum, June 1926, WFJ (NMI) (Johnson, 1927: p. 159 as *Glyphicnemis*. ♂. I took at Dundrum, 8 July 1921, a ♂ specimen which varies as follows: hind legs entirely black, anterior femora black with apex red, apophyses very strong and sharp, body with marked black pilosity. Dr A. Roman, to whom I submitted it, says he has Swedish and Esthonian ♂♂ of the same variety); Greencastle, ♂ 22 August 1930, sandhills, WFJ (NMI) (Johnson, 1931: p. 140 as *Stylocryptus*); Newcastle, August 1926, WFJ (Johnson, 1927: p. 159 as *Glyphicnemis*. ♂); Rostrevor, August 1922, WFJ (Johnson, 1922: p. 38 as *Glyphicnemis*); same locality, ♂♂ 26 and 28 August 1929 (NMI), field, WFJ (Johnson, 1930: p. 157 as *Stylocryptus*. *Fide* Dr A. Roman); LOUTH: Termonfeckin, August 1924, WFJ (Johnson, 1927: p. 159 as *Glyphicnemis*. ♂); MAYO: Carrowmore Hill, 500ft, {♂ 19 July 1910}, swept, CM (NMI); Clare Island, ♂♂ July 1910, on hogweed *Heracleum* flower, CM (NMI) (Morley, 1911a: p. 11 as *Glyphicnemis*).

***Endasys erythrogaster* (Gravenhorst, 1829)**

ARMAGH: Poyntzpass, ♀ 9 August 1909, WFJ (NMI) (Johnson, 1912a: p. 78 as *Glyphicnemis*); DOWN: Dundrum, June 1926, WFJ; Newcastle, August 1926, WFJ (NMI) (Johnson, 1927: p. 159 as *Glyphicnemis*. ♂); Rostrevor, ♀ 8 July, WFJ (NMI) (Johnson, 1929: p. 136 as *Stylocryptus*); LOUTH: Termonfeckin, July 1924, WFJ (Johnson, 1927: p. 159 as *Glyphicnemis*. ♂); MAYO: Westport, ♀ July, JNH (Morley, 1911a: p. 11 as *Glyphicnemis*).

***Endasys senilis* (Gmelin, 1790)**

ANTRIM: Killead, ♀ August 1923, WFJ (NMI) (Johnson, 1927: p. 159 as *Glyphicnemis*); DONEGAL: Portnoo, June, mountain road, WFJ (NMI) (Johnson, 1919a: p. 35 as *Glyphicnemis*).

***Endasys varipes* (Gravenhorst, 1829)**

DOWN: Rostrevor, ♀ 17 July 1930, in garden, WFJ (NMI) (Johnson, 1931a: p. 54 as

Stylocryptus); LOUTH: Dundalk, ♀ 14 July, WFJ (NMI) (Johnson, 1929: p. 136 as *Stylocryptus*).

***Ethelurgus vulnerator* (Gravenhorst, 1829)**

DOWN: Rostrevor, ♀ 21 September 1930, in greenhouse, WFJ (NMI) (Johnson, 1931a: p. 54 as *Phygadeuon. Teste Dr Roman*); WICKLOW: no locality (Townes, 1983: p. 132).

****Eudelus scabriculus* (Thomson, 1884)**

New to Ireland

DOWN: Tollymore Park, 16 May 1961, AWS (NMI).

***Gelis acarorum* (Linnaeus, 1758)**

synonym *Gelis fraudulentus* (Förster, 1850)

KERRY: Waterville, July, WJY (Morley, 1907a: p. 196 as *Pezomachus*); MAYO: Clare Island, ♀ July 1910, CM (NMI) (Morley, 1911a: p. 11 as *Pezomachus fraudulentus*).

***Gelis agilis* (Fabricius, 1775)**

synonym *Gelis instabilis* (Förster, 1850)

MAYO: Clare Island, ♀ July 1910, CM (NMI) (Morley, 1911a: p. 11 as *Pezomachus instabilis*); WEXFORD: Enniscorthy, AB; Kilmore, AB (Morley, 1907a: p. 228 as *Pezomachus instabilis*).

Ireland (Stelfox, 1929: p. 67 as *Gelis instabilis*. Mr Gwynn also brought me some *Phobocampa* cocoons in July, 1926, bred from a small tortoiseshell *V. urticae* (now *Aglais urticae* (L.)) (Lepidoptera: Nymphalidae), from which, between the 3rd and 7th of the following month I bred 4♀♀).

***Gelis albipalpus* (Thomson, 1884)**

CLARE (V.C. H9): no locality (RSM) (Schwarz and Shaw, 1999: p. 124).

Ireland (Yu, 1998: CD-Rom).

***Gelis anthracinus* (Förster, 1850)**

synonym *Gelis gonatopinus* (Thomson, 1884)

CAVAN (V.C. H30): no locality (RSM); DUBLIN: North Bull Island, 1960-1963, salt marsh, BH (det. AWS) (Speight and Healy, 1977: p. 153); KILDARE (V.C. H19):

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

no locality (RSM) (both Schwarz and Shaw, 1999: p. 124); MAYO: Carrowmore Hill {Louisburgh}, ♀ {July 1910}, under a stone, CM (NMI) (Morley, 1911a: p. 11 as *Pezomachus*); WEXFORD: Kilmore, ♀ 20 August 1898, AB (Morley, 1907a: p. 207 as *Pezomachus gonatopinus*).

Ireland (Yu, 1998: CD-Rom).

***Gelis areator* (Panzer, 1804)**

ARMAGH: Poyntzpass, 7 October 1921, study window, WFJ (NMI) (Johnson, 1922b: p. 69 as *Hemiteles*); CAVAN (V.C. H30): no locality (RSM); CLARE (V.C. H9): no locality (RSM) (both Schwarz and Shaw, 1999: p. 125); DUBLIN: Castleknock, ♀ 17 June 1989, on the inside of a window in a suburban house, JMOC (NMI) (det. C. van Achterberg) (unpublished); KILDARE (V.C. H19): no locality (RSM); WICKLOW (V.C. H20): no locality (RSM) (both Schwarz and Shaw, 1999: p. 125); Deputy's Pass, ♀ 11 September 1932, AWS (NMI) (unpublished).

Ireland (Yu, 1998: CD-Rom).

***Gelis cinctus* (Linnaeus, 1758)**

synonym *Gelis bicolorinus* (Gravenhorst, 1829)

ARMAGH: Poyntzpass, September, study table, WFJ (Johnson, 1922b: p. 69 as *Hemiteles bicolorinus*); DOWN: Newcastle, ♀ 13 June, WFJ (Johnson, 1929: p. 136 as *Hemiteles bicolorinus*); Rostrevor, ♀ May 1923, in study window, WFJ (Johnson, 1927: p. 159 as *Hemiteles bicolorinus*); DUBLIN: Harold's Cross, ♀ 27 August 1930, AWS (NMI) (det. JFP as *Gelis bicolorinus*) (unpublished).

***Gelis cursitans* (Fabricius, 1775)**

ARMAGH: Poyntzpass, hill, 16 September 1920, WFJ (NMI) (Johnson, 1921a: p. 105 as *Pezomachus*).

***Gelis fallax* (Förster, 1850)**

synonym *Gelis nigricornis* (Förster, 1850)

DOWN: Rostrevor, ♀ 19 May 1929, vicarage, R. G. Atkinon (Johnson Collection) (NMI) (det. JFP as *Hemiteles nigricornis*) (unpublished); WEXFORD (V.C. H12):

Ballyteige, ♂ 4 August 1950, RCF (Schwarz and Shaw, 1999: p. 130 tentatively identified).

Ireland (Yu, 1998: CD-Rom).

***Gelis hortensis* (Christ, 1791)**

CLARE: (V.C. H9): no locality (RSM); DERRY (V.C. H40): no locality (RSM); WICKLOW (V.C. H20): no locality (RSM) (all Schwarz and Shaw, 1999: p. 131).

Ireland (Yu, 1998: CD-Rom).

***Gelis kiesenwetteri* (Förster, 1850)**

CORK (V.C. H3): no locality (RSM) (Schwarz and Shaw, 1999: p. 132); MAYO: Clare Island, ♀ July 1910, CM (NMI) (Morley, 1911a: p. 11 as *Pezomachus*); WEXFORD: Enniscorthy, September, AB (Morley, 1907a: p. 187 as *Pezomachus*).

Ireland (Yu, 1998: CD-Rom).

***Gelis longicauda* (Thomson, 1884)**

KERRY (V.C. H1 or H2): no locality (RSM) (Schwarz and Shaw, 1999: p. 132).

Ireland (Yu, 1998: CD-Rom).

****Gelis mangeri* (Gravenhorst, 1815)**

New to Ireland

synonym *Catalytus fulveolatus* (Gravenhorst, 1829)

LIMERICK: Cool Beg, Kiltteely, ♂ 15 August 1934, EOM (NMI) (det. AWS as *Catalytus fulveolatus*, conf. JFP).

***Gelis melanocephalus* (Schrank, 1781)**

synonym *Pezomachus fasciatus* Fabricius, 1793

ARMAGH: Poyntzpass, 2 February 1910, in moss under pine *Pinus*, WFJ (Johnson, 1912a: p. 78 as *Pezomachus*; Johnson, 1920c: p. 66 as *Pezomachus*); CAVAN (V.C. H30): no locality (RSM) (Schwarz and Shaw, 1999: p. 134); DONEGAL: Coolmore, on roadside at Umbelliferae, WFJ (Johnson, 1915: p. 131 as *Pezomachus fasciatus* Fab); MAYO: Belclare, JNH; Louisburgh, CM (Morley, 1911a: p. 11 as *Pezomachus*); WEXFORD: Enniscorthy, AB; Kilmore, AB (Morley, 1907a: p. 234).

Ireland (Yu, 1998: CD-Rom).

***Gelis melanophorus* (Förster, 1851)**

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

CLARE (V.C. H9): no locality (RSM) (Schwarz and Shaw, 1999: p. 135).

Ireland (Yu, 1998: CD-Rom).

****Gelis micrurus* (Förster, 1850)**

New to Ireland

DUBLIN: Gollierstown, ♀ 13 July 1947, AWS (NMI) (det. AWS and conf. JFP).

***Gelis mutillatus* (Gmelin, 1790)**

synonym *Gelis vagans* (Olivier, 1792)

ARMAGH: Poyntzpass, January, in moss in wood, WFJ (Johnson, 1915: p. 15 as *Pezomachus vagans*; Johnson, 1920c: p. 66 as *Pezomachus vagans*); DOWN: Sliderry Ford, ♀ 6 September 1955, AWS (NMI) (det. JFP as *Gelis vagans*) (unpublished).

***Gelis proximus* (Förster, 1850)**

synonym *Gelis analis* (Förster, 1850)

CAVAN (V. C. H9): no locality (RSM) (Schwarz and Shaw, 1999: p. 137); KERRY: Waterville, ♀ 27 July 1901, JWY (Morley, 1902: p. 55 as *Pezomachus analis*. I am indebted to Mr Ernest A. Elliott for the determination of this species); WICKLOW: (V. C. H20): no locality (RSM) (Schwarz and Shaw, 1999: p. 137).

***Gelis ruficornis* (Retzius, 1783)**

synonym *Pezomachus tristis* Förster, 1850

DONEGAL: Coolmore, ♀ August 1917, among sallows *Salix*, WFJ (Johnson, 1918: p. 108 as *Pezomachus tristis* Fabr.).

***Gelis rufogaster* Thunberg, 1827**

synonym *Gelis carnifex* (Förster, 1850)

synonym *Gelis gracilis* (Förster, 1850)

synonym *Gelis rufulus* (Förster, 1850)

DERRY (V.C. H40): no locality (RSM) (Schwarz and Shaw, 1999: p. 138);

DONEGAL: Coolmore, among sallows *Salix*, WFJ (NMI) (Johnson, 1915: p. 131 as *Pezomachus carnifex*); Portnoo, September, cliff, WFJ (NMI) (Johnson, 1919a: p. 35 as *Pezomachus carnifex* var. *rufulus* Forst); DUBLIN: The Slade of Saggart, ♀ 12 August 1936, AWS (NMI) (det JFP as *Hemiteles gracilis*); WEXFORD: Courtown

(Courten), September, AB; Kilmore, end of August and September, AB (both Morley, 1907a: pp 221-222 as *Pezomachus carnifex*); WICKLOW (V.C. H20): no locality (RSM) (Schwarz and Shaw, 1999: p. 138).

Ireland (Yu, 1998: CD-Rom).

***Gelis spinula* (Thomson, 1884)**

CAVAN (V.C. H30): Eighter, Lough Ramor, ♀ 7 June 1940, RCF (RSM) (Schwarz and Shaw, 1999: p. 139).

Ireland (Yu, 1998: CD-Rom).

***Gelis viduus* (Förster, 1850)**

DERRY (V.C. H40): no locality (RSM) (Schwarz and Shaw, 1999: p. 140).

Ireland (Yu, 1998: CD-Rom).

***Glyphicnemis atrata* (Strobl, 1901)**

synonym *Glyphicnemis suffolciensis* (Morley, 1907)

ANTRIM: Killead, ♀ August 1923, WFJ (NMI) (Johnson, 1927: p. 159 as *Glyphicnemis suffolciensis*); ARMAGH: Poyntzpass, July, in field at hogweed *Heracleum*, fields, WFJ (NMI) (Johnson, 1915: p. 131 as *Glyphicnemis suffolciensis*; Johnson, 1919a: p. 35 as *Glyphicnemis suffolciensis*).

****Glyphicnemis clypealis* (Thomson, 1883)**

New to Ireland

KILDARE: Landenstown, 21 August 1946, AWS (NMI).

ANTRIM: Cave Hill, 31 July 1909, found on umbelliferous flowers, HLO (Johnson, 1912a: p. 78); Killead, August 1923, WFJ (NMI) (Johnson, 1927: p. 159 ♀); ARMAGH: Poyntzpass, July, in fields, WFJ (NMI); DOWN: Dundrum, ♀ July 1926 (var. *podagrica* Gravenhorst (*teste* Roman), WFJ (NMI) (Johnson, 1927: p. 159 ♀); Rostrevor, July 1922, September 1923 (NMI), WFJ (Johnson, 1923: p. 38; Johnson, 1927: p. 159 ♀); KERRY: Kenmare, ♀ 22 August 1901, JWY (Morley, 1902: p. 55 as *Stylocryptus*); WATERFORD: Cappoquin, July, JJK (Johnson, 1917a: p. 38).

***Gnotus tenuipes* (Gravenhorst, 1829)**

synonym *Hemiteles tenuicornis* Gravenhorst, 1829

DOWN: Dromore, ♀ August 1925, WFJ (NMI) (Johnson, 1927: p. 159 as *Hemiteles tenuicornis*).

***Helcostizus restaurator* (Fabricius, 1775)**

synonym *Helcostizus brachycentrus* (Gravenhorst, 1829)

ARMAGH: Poyntzpass, {8} September {1921}, hill, WFJ (NMI) (Johnson, 1922b: p. 69 as *Helcostizus brachycentrus*).

***Hemiteles bipunctator* (Thunberg, 1824)**

synonym *Hemiteles cingulator* Gravenhorst, 1829

synonym *Hemiteles tristator* Gravenhorst, 1829

ANTRIM: Killead, ♂ August 1923, WFJ (Johnson, 1927: p. 159 as *Hemiteles tristator*); ARMAGH: Jerrettspass, June, on Umbelliferae at roadside, WFJ (Johnson, 1914a: p. 65 as *Hemiteles cingulator*); Poyntzpass, June, in window of house, WFJ (Johnson, 1915: p. 131 as *Hemiteles cingulator*); same locality, July 1916, in stable

window and in fields, WFJ (Johnson, 1917a: p. 38 as *Hemiteles cingulator*); same locality, June 1916, on hill, July 1916, in stable, WFJ (Johnson, 1917a: p. 38 as *Hemiteles tristator*); same locality, 6 January, in store-room, WFJ (Johnson, 1922b: p. 69 as *Hemiteles cingulator*); CAVAN (VC. H30): no locality (Schwarz and Shaw, 2000: p. 173); DONEGAL: Coolmore, September 1916, in porch of bungalow, WFJ (Johnson, 1917a: p. 38 as *Hemiteles tristator*); Portnoo, June, in house, WFJ (Johnson, 1919a: p. 35 as *Hemiteles tristator*); DOWN: Rostrevor, ♀ July 1923, in window, WFJ (Johnson, 1927: p. 159 as *Hemiteles cingulator*); same locality, ♀ 1930, in dining room window, WFJ (Johnson, 1931a: p. 54 as *Hemiteles cingulator*). There are numerous WFJ specimens in NMI.

***Hemiteles similis* (Gmelin, 1790)**

ARMAGH: Poyntzpass, July, in fields, WFJ (Johnson, 1914a: p. 65); same locality, July, in stable, WFJ (NMI) (Johnson, 1916a: p. 20); no locality (Schwarz and Shaw, 2000: p. 175 VC H30); DOWN: Greencastle, ♀ 21 August 1930, on roadside, WFJ (NMI) (Johnson, 1931c: p. 140); Newcastle, ♀ 25 October {1927}, on outside of window, (NMI), ♂ 11 May {1927}, WFJ (NMI) (Johnson, 1929: p. 136).

[*Hemiteles* sp.]

MAYO: Clare Island, ♂ June 1911, WFJ (Morley, 1911a: p. 11)].

***Isadelphus armatus* (Gravenhorst, 1829)**

synonym *Hemiteles bidentulus* Thomson, 1884

DOWN: Greencastle, ♀ 16 August 1930, sandhills, WFJ (NMI) (Johnson, 1931: p. 140 as *Hemiteles bidentulus*. Dr Roman considers that this should be called *Ecthrus armatus*).

***Isadelphus gallicola* (Bridgman, 1880)**

ARMAGH: Poyntzpass, field, hill, {28} August {1920} (NMI), May, WFJ (Johnson, 1921a: p. 105 as *Cecidonomus*; Johnson, 1922b: p. 69 as *Cecidonomus*).

***Isadelphus inimicus* (Gravenhorst, 1829)**

DOWN: Rostrevor, ♀ 31 May 1930, in dining room window, WFJ (Johnson, 1931a:

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

p. 54 as *Cecidonomus*).

****Leptocryptoides clavipes* (Thomson 1888)**

New to Ireland

LEITRIM: Tullaghan, ♀ October 1937, AWS (BMNH) (det JFP).

***Lysibia nanus* (Gravenhorst, 1829)**

synonym *Lysibia fulvipes* (Gravenhorst, 1829)

ARMAGH: Armagh, WFJ (Johnson, 1904a: p. 256 as *Hemiteles fulvipes*; Morley, 1907a: p. 124 as *Hemiteles fulvipes*); Poyntzpass, 8 May {1918}, emerged from dark

smoky coloured cocoon, WFJ (NMI) (Johnson, 1919a: p. 35 as *Hemiteles fulvipes*);

DOWN: Warrenpoint, ♀ 5 September, in dining room window facing south-east, WFJ

(Johnson, 1929: p. 136 as *Hemiteles fulvipes*); KERRY: no locality (Townes, 1983: p.

173).

***Lysibia tenax* Townes, 1983**

DUBLIN: no locality (Townes, 1983: p. 172).

Ireland (Schwarz and Shaw, 2000: p. 167).

***Mastrus deminuens* (Hartig, 1838)**

synonym *Mastrus castaneus* (Taschenberg, 1865)

ARMAGH: Armagh, WFJ (Johnson, 1904a: p. 256 as *Hemiteles castaneus*; Morley, 1907a: p. 137 as *Hemiteles castaneus*).

***Mastrus fumipennis* (Thomson, 1884)**

DONEGAL: Portnoo, ♀ 17 September 1918, among grass and vetches in a small meadow on the cliff, WFJ (NMI) (Johnson, 1920b: p. 10 as *Hemiteles*. Determined by

Dr A. Roman; Morley, 1921: p. 53 as *Hemiteles*).

***Mastrus ridibundus* Gravenhorst, 1829**

DONEGAL: Coolmore, September, on roadside, WFJ (NMI) (Johnson, 1914a: p. 65 as *Hemiteles*); Portnoo, September, cliff, WFJ (NMI) (Johnson, 1919a: p. 35 as

Hemiteles).

****Mastrus varicoxis* (Taschenberg, 1865)**

New to Ireland

TIPPERARY: Aherlow, ♂ 17 September 1943, AWS (NMI) (det. JFP as *Hemiteles*).

***Medophron mixtus* (Bridgman, 1883)**

ARMAGH: Poyntzpass, June, in stable window, WFJ (Johnson, 1915: p. 131 as *Phygadeuon*); DOWN: Warrenpoint, ♀ 27 July {1928}, WFJ (NMI) (Johnson, 1929: p. 136 as *Phygadeuon*).

***Megacara hortulana* (Gravenhorst, 1829)**

synonym *Phygadeuon rusticellae* Bridgman, 1886

ARMAGH: Poyntzpass, Hill, {27} April {1921}, WFJ (NMI) (Johnson, 1922b: p. 69 as *Phygadeuon rusticellae* var. *subtilis* Gravenhorst).

***Megacara vagans* (Gravenhorst, 1829)**

ANTRIM: Killead, ♂ August 1923, WFJ (Johnson, 1927: p. 159 as *Phygadeuon*); DOWN: Greencastle, ♀ 22 August 1930, sandhills, WFJ (NMI) (Johnson, 1931c: p. 140 as *Phygadeuon*); Rostrevor, ♂ 5 August 1929, WFJ; same locality, Killowen beach, ♂ 29 August 1929, Helen Craig (both Johnson, 1930: p. 157 as *Phygadeuon*).

***Mesoleptus congener* (Förster, 1876)**

Ireland (Broad, 2006).

***Mesoleptus incertus* (Förster, 1876)**

Ireland (Broad, 2006).

***Mesoleptus incessor* (Haliday, 1839)**

synonym *Mesoleptus marginatus* (Thomson, 1884)

ARMAGH: Poyntzpass, 12 August 1920, WFJ (as *marginatus*) (NMI); DOWN: Rostrevor, 16 June 1931, house, WFJ (as *marginatus*) (NMI).

***Mesoleptus laevigatus* (Gravenhorst, 1820)**

ARMAGH: Poyntzpass, in fields, August, at hogweed *Heracleum*, WFJ (NMI) (Johnson, 1921a: p. 105 as *Exolytus*); DONEGAL: Coolmore, August 1917, among sallows *Salix*, WFJ (NMI) (Johnson, 1918: p. 108 as *Exolytus*); DOWN: Greencastle, ♂ 22{21} August 1930, WFJ (NMI) (Johnson, 1931c: p. 140 as *Exolytus*); Rostrevor, ♀ 6 September 1930, in greenhouse, WFJ (NMI) (Johnson, 1931a: p. 54 as *Exolytus*. *Teste* Dr Roman); DUBLIN: Bog of the Ring, September 1902, JNH (NMI) (Morley, 1911c: p. 20 as *Exolytus*; Anon., 1913: p. 43 as *Exolytus*); LOUTH: Termonfeckin, ♂ September 1924, WFJ (NMI) (Johnson, 1927: p. 159 as *Exolytus*); WEXFORD:

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

Kilmore (Morley, 1907a: p. 256 as *Exolytus*).

Ireland (Jussila, 1979a: p. 42).

***Mesoleptus petiolaris* (Thomson, 1884)**

Ireland (Broad, 2006).

***Mesoleptus scrutator* (Haliday, 1839)**

DOWN: Rostrevor, ♂ 5 July 1930, in field opposite, WFJ (Johnson, 1931a: p. 54 as *Exolytus scrutator*).

Ireland (Haliday, 1839: p. 118 as *Atractodes scrutator*; Morley, 1907a: p. 256 as *Exolytus scrutator*; Fitton, 1976: p. 332 as *Atractodes scrutator*. Lectotype ♀...by fixation of Morley (1913) (NMI)).

***Mesoleptus petiolaris* (Thomson, 1884)**

ARMAGH: Poyntzpass, in fields, August, at hogweed *Heracleum*, WFJ (NMI) (Johnson, 1921a: p. 105 as *Exolytus*).

****Obisiphaga stenoptera* (Marshall, 1868)**

New to Ireland

TIPPERARY: Aherlow, ♀ 13 September 1943, AWS (NMI) (det. AWS).

[*Oecotelma* sp.]

Ireland (Townes, 1969b: p. 95 undetermined species).]

***Orthizema pullator* (Gravenhorst, 1829)**

DOWN: Newcastle, ♀ August 1926, in window, WFJ (Johnson, 1927: p. 159 as *Hemiteles*).

***Phygadeuon ambiguus* Gravenhorst, 1829**

ARMAGH: Poyntzpass, August, in fields, WFJ (NMI); DONEGAL: Coolmore, September 1916, on roadside among herbage, WFJ (NMI) (Johnson, 1917a: p. 38).

***Phygadeuon cephalotes* Gravenhorst, 1829**

DOWN: Rostrevor, ♀ 8 August 1929, field opposite, WFJ (NMI) (det. AR) (Johnson, 1930: p. 157).

***Phygadeuon dimidiatus* Thomson, 1884**

ANTRIM: Killead, ♀ August 1927: p. 159 as *Phygadeuon*); DONEGAL: Coolmore, at Umbelliferae on roadside, WFJ (Johnson, 1915: p. 131 as *Phygadeuon*); DOWN:

Greencastle, ♀ 15 August 1930, roadside, WFJ (NMI) (Johnson, 1931c: p. 140); MAYO: Lough Namucka, ♀ July 1910, JNH (NMI) (Morley, 1911a: p. 11).

***Phygadeuon dubius* (Gravenhorst, 1829)**

synonym *Phygadeuon scaposus* Thomson, 1884

ARMAGH: Poyntzpass, July, in stable window, WFJ (NMI); DONEGAL: Coolmore, on roadside among herbage, WFJ (NMI) (Johnson, 1915: p. 131 as *Phygadeuon scaposus*); Portnoo, September, cliff, WFJ (Johnson, 1919a: p. 35 as *Phygadeuon scaposus*); LOUTH: Termonfeckin ♀ July 1924, WFJ (Johnson, 1927: p. 159 as *Phygadeuon scaposus*).

***Phygadeuon dumetorum* Gravenhorst, 1829**

ARMAGH: Poyntzpass, ♂ 30 August 1909, WFJ (NMI) (Johnson, 1912a: p. 78); DONEGAL: Coolmore, {29 September 1914}, on roadside at Umbelliferae, WFJ (NMI) (Johnson, 1915: p. 131); MAYO: Clare Island, ♀ July 1910, CM (NMI) (Morley, 1911a: p. 11).

***Phygadeuon exiguus* Gravenhorst, 1829**

ARMAGH: Poyntzpass, {26} April {1918}, {12} August {1914}, herbage, sweeping in field, WFJ (NMI) (Johnson, 1915: p. 131; Johnson, 1919a: p. 35); DONEGAL: Coolmore, on roadside, WFJ (Johnson, 1915: p. 131); DOWN: Rostrevor, Victoria Square, ♀♀ 6 September 1929, WFJ (NMI) (Johnson, 1930: p. 157 both *fide* Dr A. Roman); MAYO: Clare Island, ♂ July 1910, CM (NMI) (Morley, 1911a: p. 11); WATERFORD: Stradbally, ♂ 22-30 June 1907, HWA (Morley, 1908b: p. 276).

***Phygadeuon fumator* Gravenhorst, 1829**

ANTRIM: Killead, August 1923, WFJ (NMI) (Johnson, 1927: p. 159 ♀); ARMAGH: Poyntzpass, 9 March 1910, moss in wood, WFJ (NMI) (Johnson, 1912a: p. 78; Johnson, 1920c: p. 66); DONEGAL: Coolmore, {19} September {1914}, on the sandhills, WFJ (NMI) (Johnson, 1914a: p. 65); DOWN: Rostrevor, June 1923, WFJ (Johnson, 1927: p. 159 ♀); MAYO: Achill Sound, {June 1910}, WFJ (NMI); Carrowmore Hill, CM; Carrowmore Lough, CM; Clare Island, several ♂♂ {July 1910}, CM (NMI); Darby's Point, {June 1910}, WFJ (NMI) (Morley, 1911a: p. 11).

***Phygadeuon hercynicus* Gravenhorst, 1829**

synonym *Phygadeuon brevitarsis* Thomson, 1884

ANTRIM: Killead, ♂ August 1923, WFJ (NMI) (Johnson, 1927: p. 159); ARMAGH: Poyntzpass, August 1916, in fields, WFJ (NMI) (Johnson, 1917a: p. 38); DONEGAL: Coolmore, August 1912, September (NMI), on roadside among herbage, WFJ (Johnson, 1913: p. 139; Johnson, 1917a: p. 38); DOWN: Greencastle, ♀ 22 August 1930, sandhills, WFJ (Johnson, 1931c: p. 140); LAOIS (LEIX): Emo Park (BMNH) (Horstmann, 2001: p. 214 as *Phygadeuon brevitarsis*); LOUTH: Carlingford, June 1921, WFJ (NMI) (Johnson, 1921a: p. 17 as *Phygadeuon brevitarsis*).

***Phygadeuon infelix* Dalla Torre, 1901**

synonym *Phygadeuon inflatus* Thomson, 1884 preoccupied

ARMAGH: Poyntzpass, ♂♀ June, August (NMI), in fields, field at angelica *Angelica*, WFJ (one of the latter had the legs dark) (Johnson, 1917a: p. 38 as *Phygadeuon inflatus*; Johnson, 1918: p. 108 as *Phygadeuon inflatus*; Johnson, 1922b: p. 69 as *Phygadeuon inflatus*); DONEGAL: Coolmore, September 1916, on wild carrot *Daucus carota*, WFJ (Johnson, 1917a: p. 38 as *Phygadeuon inflatus*); DOWN: Greencastle, ♀ 18 August 1930, roadside, WFJ (NMI) (Johnson, 1931c: p. 140 as *Phygadeuon inflatus*); Newcastle, ♀ 9 September, WFJ (Johnson, 1929: p. 136 as *Phygadeuon inflatus*); LOUTH: Carlingford, June 1921, WFJ (NMI) (Johnson, 1921a: p. 17 as *Phygadeuon inflatus*).

***Phygadeuon leucostigmus* Gravenhorst, 1829**

ANTRIM: Killead, ♀ August 1923, WFJ (NMI) (Johnson, 1927: p. 159); DONEGAL: Coolmore, August 1912, WFJ (NMI) (Johnson, 1913: p. 139); Portnoo, {9} September {1918}, cliff, WFJ (NMI) (Johnson, 1919a: p. 35).

***Phygadeuon nitidus* Gravenhorst, 1829**

ANTRIM: Killead, ♂ August 1923, WFJ (NMI) (Johnson, 1927: p. 159); DONEGAL: Coolmore, September, on roadside, WFJ (NMI) (Johnson, 1914a: p. 65); MAYO: north-east Achill, ♂ June 1909, JNH (NMI); Clare Island, ♂ June 1910 {September 1910}, WFJ (NMI) (Morley, 1911a: p. 11).

***Phygadeuon ovatus* Gravenhorst, 1829**

ARMAGH: Poyntzpass, ♀ June, in a window, WFJ (Johnson, 1918: p. 108).

****Phygadeuon pallicarpus* Thomson, 1884****New to Ireland**

LIMERICK: Limerick, ♀ 15 June 1913, CM (BMNH).

****Phygadeuon rotundipennis* Thomson, 1884****New to Ireland**

CORK: Glengarriff, 26 July 1935, on shore, AWS (NMI); MAYO: The Mullet, 16 June 1936, AWS (NMI).

***Phygadeuon rugulosus* Gravenhorst, 1829**

DOWN: Newcastle, ♂♂ 23 September and 8 October, WFJ (NMI) (Johnson, 1929: p. 136).

***Phygadeuon subtilis* Gravenhorst, 1829**

synonym *Phygadeuon flavicans* Thomson, 1884

synonym *Phygadeuon oppositus* Thomson, 1844

DONEGAL: Portnoo, ♀ September, among sallows *Salix* on the roadside, WFJ (Johnson, 1920b: p. 19 determined by Dr A. Roman as *Phygadeuon oppositus*);

DOWN: Newcastle, ♂♂ 9 May, 4 June, 29 September and 15 October, WFJ; Rostrevor, ♀ 14 July, WFJ (both Johnson, 1929: p. 136 as *Phygadeuon flavicans*);

WICKLOW: Glending Wood, ♀ 9 October 1946, AWS (NMI) (det. JFP as *Phygadeuon oppositus*) (unpublished).

***Phygadeuon variabilis* Gravenhorst, 1829**

ARMAGH: Poyntzpass, ♂, WFJ (NMI) (Johnson, 1912a: p. 78); KERRY: Rossbeigh, HD (Morley, 1907a: p. 89); MAYO: Carrowmore Hill, on the top...at 500ft, ♂♂, CM; Mount Brown Lough, ♂♂, JNH (NMI) (Morley, 1911a: p. 11).

***Platyrhabdus inflatus* (Thomson, 1884)**

synonym *Platyrhabdus rufus* (Morley, 1907)

ARMAGH: Poyntzpass, WFJ (Johnson, 1913: p. 139 as *Phygadeuon rufus*);

DUBLIN: Rockbrook, ♀ 21 October 1954, AWS (NMI) (det. JFP as *Hemiteles*).

***Polyaulon paradoxus* (Zetterstedt, 1838)**

CORK (West): Glengarriff, ♀ 31 July 1924, JNH (NMI); DOWN: Knocknagoney (K

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

n goney), near Holywood, ♀ probably between 1833 and 1845, AHH, det. CM (NMI); GALWAY (West): Craigamore Lough, ♀ 10 September 1928, under a stone on the shore, AWS (NMI) (Stelfox, 1946: p. 139 as *Thaumatotypus*).

Ireland (Beirne, 1941a: p. 676 as *Diplazon*. ♂ 4♀♀; Jussila, 1965: p. 120 as *Tymmophorus graculus graculus*).

CTENOPELMATINAE

Like the Tryphoninae this is a moderately large subfamily, whose main hosts are sawflies, and which is best represented in the north temperate regions of the world. Unlike the Tryphoninae, the species develop as endoparasites. Despite the fact that many ctenopelmatines attack important sawfly pests in forests, and that some species have been used in successful biological control programmes, the taxonomy of the subfamily has received scant attention.

The Ctenopelmatinae is represented in the British Isles by more than 200 species from about 50 genera. Unless care is taken, adult ctenopelmatines can easily be confused with tryphonines. The morphological similarities between the two groups are undoubtedly connected with their parasitism of sawflies.

Although the vast majority of ctenopelmatines are thought to develop as koinobiont internal parasites of sawfly larvae, at least one species has been reared from Eriocraniidae (Lepidoptera).

Members of the tribe Pionini have very slender ovipositors and deposit their egg in the egg of the host sawfly. In the North American species *Glyptorhaestus tomostethae* (Cushman) the egg is placed in the yolk cells of the eggs of its tenthredinid host

Tomostethus and the parasite egg or newly hatched larva thus becomes enveloped in the mesenteron of the host. About the time of host hatching the parasite larva migrates to the thoracic segments and takes up a position below the gut but above the fat body. It maintains this position during the two-week feeding period of the host. Although the *Glyptorhaestus* larva does not moult during this time it does increase greatly in size. The first instar larva has an anal vesicle, which becomes invaginated after the moult to the second instar. The host enters the ground and forms an earthen pupation chamber. The parasite larva moults to the second larval instar about the time the host enters the ground and the remainder of its development occupies about the same time as the first instar and it is full-grown and spins its cocoon in early summer. It remains quiescent until about mid September when it pupates. The adult 'emerges' in autumn but remains in the cocoon until the following spring. It is not clear if the imaginal moult takes place in the autumn or if the winter is passed as a pharate adult.

The small tribe Ctenopelmatini have Pamphiliidae as hosts. Females of some species-groups of *Ctenopelma* have slender ovipositors which lack a subapical notch and it is known that one of these species oviposits into the host egg. Other species of *Ctenopelma* oviposit into the host larva, as do the majority of species of the subfamily as a whole.

Some members of the genus *Lathrolestes* parasitise leaf miners of the sawfly tribe Fenusini and of the lepidopterous family Eriocraniidae. A female of *Lathrolestes nigricollis* (Thomson) will search the surface of birch leaves, apparently using her antennae to find mines of the host *Fenusa pusilla* (Lepeletier) and once located she uses her ovipositor to stab randomly into the mine. Oviposition is accomplished in a few seconds. Host feeding by the adult female occurs when, as a consequence of oviposition, a droplet of host haemolymph appears on the surface of the mine.

Euryproctini

**Anisotacrus tenellus* (Holmgren, 1857)

AWS (as *ruficornis*) (NMI).

Scolobatini

****Scolobates auriculatus* (Fabricius, 1804)**

New to Ireland

CORK: Glengarriff, 13 July 1924, AWS (NMI); KERRY: Killarney, July 1930, L. (Lake) Shore, EFB (NMI).

CYLLOCERINAE

This is a very small subfamily which includes only the four genera *Cylloceria*, *Allomacrus*, *Hyperacmus* and *Sweaterella*. It is Holarctic and Neotropic in distribution. Little is known of the biology of this group although there are host records for a few species of *Cylloceria*, which have been reared from *Tipula* (Diptera, Tipulidae). There is also one unconfirmed record of the genus *Hyperacmus* from a stratiomyid.

****Allomacrus arcticus* (Holmgren, 1880)**

New to Ireland

ANTRIM: Rea's Wood, f 5-11 June 1985, Malaise trap, MRB and RN (NMI) (det. MRB).

***Cylloceria caligata* (Gravenhorst, 1829)**

DOWN: Newcastle, August, on sandhills, WFJ (Johnson, 1913: p. 140 as *Lampronota caligata*); same locality, ♂ 27 August, WFJ (Johnson, 1929: p. 136 as *Lampronota caligata*);

***Cylloceria melancholica* (Gravenhorst, 1829)**

synonym *Lampronota crenicornis* Curtis, 1832

DOWN: Holywood, July-September, AHH (Haliday, 1839: p. 121 as *Lampronota crenicornis*. Not uncommon; Morley, 1908a: p. 255 as *Lampronota caligata* [wrong synonymy]); MAYO: Louisburgh, ♂ {13 July 1910}, swept in peat bog, CM (Morley, 1911a: p. 13 as *Lampronota*).

Ireland (Morley, 1913: p. 263 as *Lampronota crenicornis*. Type (a dissected male) selected...twelve English and Irish males and females; Fitton, 1976: p. 323 as *Lampronota crenicornis*. Lectotype ♀, paralectotype ♂ (Haliday Collection) (NMI).

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

Morley's "type" has no status).

[*Lampronota denticornis* Haliday, 1839 nomen nudum

Ireland (Haliday, 1838: p. 121 as *Lampronota denticornis*; Morley, 1908a: p. 258 Haliday's *L. denticornis* which is only doubtfully synonymous [with *Lampronota accusator* Fabricius], was found by him in pine woods in Ireland during the autumn; Fitton, 1976: p. 334 as *Lampronota denticornis*. Lectotype ♀...(NM)).

****Hyperacmus crassicornis* (Gravenhorst, 1829) New to Ireland**

DUBLIN: Slade of Saggart, 16 October 1935, AWS (NMI).

DIACRITINAE

This very small, but widely distributed subfamily comprises a handful of species in three genera *Diacritus*, *Ortholaba* and *Cressonia*. The Diacritinae is one of the few subfamilies whose biology is more-or-less completely unknown.

***Diacritus aciculatus* (Vollenhoven, 1878)**

ANTRIM: Rea's Wood, ♀, 10 July 1985 MRB and RN (UM) (det. MRB and RN);
CORK: Fota, ♀ 25 July 1996, KGB (UM) (det. MRB and RN); WICKLOW:
Enniskerry, 2♂♂ emerged 26 June 1931, ex log, AWS (NMI) (det. AWS) (all unpublished).

Ireland (Fitton, Shaw and Gauld, 1988: p. 92).

DIPLAZONTINAE

The Diplazontinae is one of the smaller subfamilies with 18 genera. It is world-wide in distribution but the majority of species are found in the north temperate zone. Twelve genera are represented in the British Isles, by about fifty species. One species, *Diplazon laetatorius* (Fabricius), may well be the most common and widely distributed ichneumonid, occurring all over the world, from the far north of Europe to tropical Pacific islands. It is normally thelytokous, although some North American populations include males.

Members of this subfamily are easily distinguished from other ichneumonids by

their general appearance. Should there be any doubt, the main confirmatory characters are the bifid upper tooth of the mandible and the sub-rectangular shape of the first tergite of the metasoma.

Diplazontines attack aphidophagous hoverflies (Diptera: Syrphidae). Until fairly recently the reliable, published biological data strongly suggested them to be specialized parasites of only this group of hosts. However, one *Bioblapsis* species parasitises mycophagous hoverfly and another is associated with a hoverfly associated with sap flows on deciduous trees. Oviposition is into the host larva, or less often into the egg, and emergence of the adult is from the host puparium. Although the host forms a puparium the parasite larva prevents the actual transformation to a pupa.

In *Diplazon*, *Syrphoctonus* and *Syrphophilus* females bring the metasoma forward beneath the thorax and insert the ovipositor into the host without selecting a particular site. The species of these genera usually oviposit into young host larvae and in some cases also into the egg. They will, however, only oviposit into eggs containing well-developed embryos (those more than about 48 hours old). The egg is deposited directly into the haemocoel and the parasite larva lives free in the haemolymph. Females of *Syrphoctonus pictus* (Gravenhorst) oviposit into all host larval instars. In *Enizemum ornatum* (Gravenhorst), which selects only older larvae, a more complex sequence of events leads up to oviposition: after antennal contact the female mounts the larva, stabs with its ovipositor and bites with its mandibles. This causes the host to raise its anterior end, after which the female rapidly inserts her ovipositor just behind the host's mouthparts. The species with complex oviposition behaviour and/or which attack older larvae appear also to have more restricted host ranges. Usually only a single egg is deposited but in all cases of super- or multi-parasitism only one individual survives. The first instar larvae have large mandibles and have been observed to fight. Development from egg to adult takes about three weeks in summer and many species are multivoltine. Overwintering takes place in the first larval instar within a host larva or as a pupa within a host puparium.

The adult diplazontine escapes from the host puparium by cutting a neat circular

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

hole near its anterior end; successive semicircular strips are removed, with the mandibles, from around the edge of the hole until it is large enough for the adult to emerge. Adults are active from March to November and females commonly occur near aphid colonies, searching for hosts or feeding on syrphid eggs and larvae or aphid honeydew. The eggs devoured are often those detected, by ovipositor insertion, as being too young for oviposition. Predation of host eggs and larvae supplies proteins necessary for continued egg production. Males of some species form swarms beneath the canopies of large trees.

***Campocraspedon annulitarsis* (Hedwig, 1938)**

synonym *Campocraspedon arcanus* (Stelfox, 1941)

WICKLOW: Devil's Glen, holotype ♂ 8 June 1921, AWS (USNM) (Stelfox, 1941: p. 110 as *Homocidus arcanus*; Fitton, 1976: p. 348 as *Homocidus arcanus*); Killegar, 2♂♂ (cotypes) 25 May 1924, AWS (NMI) (Stelfox, 1941: p. 110 as *Homocidus arcanus*).

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

Ireland (Beirne, 1941a: p. 707 as *Promethes*. 34♂♂24♀♀; Townes *et al.*, 1965: p. 414).

***Sussaba dorsalis* (Holmgren, 1856)**

ARMAGH: Poyntzpass, May 1916, in field, uncommon, WFJ (Johnson, 1917a: p. 39 as *Promethus*); DOWN: Murlough NNR, ♀ July 1977, Malaise trap, RN (UM) (det. MRB and RN); KERRY: Kenmare Estate, Killarney, ♂ 8 September 1981, JPOC (NMI) (det. MRB) (both unpublished); MAYO: Louisburgh, ♂ 17 July 1910, CM (NMI) (Morley, 1911a: p. 13 as *Promethus*).

Ireland (Beirne, 1941a: p. 708 as *Promethes*. 2♂♂♀; Kerrich, 1949: p. 6 though Stelfox says he has seen no Irish specimens without them [abdominal markings]; Townes *et al.*, 1965: p. 414).

***Sussaba flavipes* (Lucas, 1849)**

synonym *Sussaba coriacea* misidentification

ANTRIM: Rea's Wood, ♀ 30 May 1975, Malaise trap, MRB and RN (UM); ARMAGH: Derryhubbert, ♂ October 1984, bog, RN (UM); CLARE: Caher River, ♂ 26 May 1975, AGI (UM); DONEGAL: Crolly Wood, ♂ 29 May 1976, RN (UM); DOWN: Cultra, ♂ 7 June 1985, swept, RN (UM); Mourne Wood, ♂ 23 June 1972, RN (UM); Murlough NNR, ♂ 29 October 1984, Malaise trap, BHN (UM); Tollymore, ♂ 21 August 1984, MRB (UM); TYRONE: Moy, ♀♀ 1-7 October 1984, Malaise trap, MRB and RN (UM) (all det. MRB and RN) (all unpublished).

Ireland (Broad (2005)).

***Sussaba pulchella* (Holmgren, 1856)**

synonym *Sussaba elongata* (Provancher, 1874)

synonym *Sussaba monticola* (Vollenhoven, 1880)

synonym *Sussaba laticarpus* (Thomson, 1890)

ARMAGH: Poyntzpass, August 1916, in field, WFJ (Johnson, 1917a: p. 39 as *Promethus*); same locality, field, ♂ August, WFJ (Johnson, 1921a: p. 106 as *Promethus laticarpus*. Variety with scutellum black); CAVAN: Virginia, ♂ 30 May 1982, JMOC (NMI) (det. MRB); CLARE: near Rathdorney River, Burren, ♂ 16 July

1981, JMOC (NMI); near Spa, Lisdoonvarna, ♂ 8 July 1981, JPOC (NMI) (det. MRB) (all unpublished); DOWN: Dromore, ♀ August 1925, WFJ (Johnson, 1927: p. 160 as *Promethus*); Murlough NNR, ♀ 9-15 October 1984, Malaise trap, BHN (UM) (det. MRB and RN) (unpublished); Newcastle, ♂ 11 June, WFJ (Johnson, 1929: p. 137 as *Promethus*); KERRY: Kenmare Estate, Killarney, ♂ 8 September 1981, JPOC (NMI) (det. MRB); Tomies Wood, Killarney, ♂ 15 September 1981, JPOC (NMI) (det. MRB) (both unpublished); MAYO: Achill, ♂ 7 June 1909, JNH (Morley, 1911a: p. 13 as *Promethus laticarpus*).

Ireland (Beirne, 1941a: p. 708 as *Promethes*. 17♂♂3♀♀; Beirne, 1941a: p. 708 as *Promethes monticola*. ♂♀; Townes *et al.*, 1965: p. 414 as *Sussaba elongata*).

***Syrphoctonus collinus* (Stelfox, 1941)**

DUBLIN: Slade Brook, Glenasmole, ♀ 1 October 1930, 1000ft altitude, beaten from ?alder *Alnus* or willow *Salix*, AWS (Stelfox, 1941: p. 111 as *Homocidus*).

Ireland (Beirne, 1941a: p. 689 as *Diplazon*. Apparently rare, but frequent where it occurs).

***Syrphoctonus crassicornis* (Thomson, 1890)**

DUBLIN: no locality, AWS; WICKLOW: Glen of Imaal, at about 1200ft by the Little Slaney River, not uncommon, AWS (NMI); no locality {Clara, ♀ 27 July 1927}, AWS (NMI) (det AR) (Stelfox, 1941: p. 117 as *Homocidus*. It flies towards the end of June and into July, and has appeared to me to be in some way associated with willow bushes (*Salix aurita* and *S. cinerea*).

***Syrphoctonus dimidiatus* (Schrank, 1802)**

ARMAGH: Poyntzpass, field, May and August, at hogweed *Heracleum*, WFJ (Johnson, 1913: p. 140 as *Homocidus*; Johnson, 1921a: p. 106 as *Homocidus*); Poyntzpass lane, July, WFJ (Johnson, 1920a: p. 9 as *Homocidus*); DONEGAL: Coolmore, September 1916, on sandhills, WFJ (Johnson, 1917a: p. 39 as *Homocidus*); Portnoo, June, roadside, WFJ (Johnson, 1919a: p. 36 as *Homocidus*); LOUTH: Carlingford, June 1921, WFJ (Johnson, 1922a: p. 17 as *Homocidus*).

Ireland (Morley, 1911b: p. 103 as *Homocidus*. Found commonly in Ireland (Haliday

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

MS in Dublin Museum)).

***Syrphoctonus elegans* (Gravenhorst, 1829)**

ARMAGH: Poyntzpass field, October, on wing at sycamore *Acer pseudoplatanus*, WFJ (Johnson, 1920a: p. 9 as *Homocidus elegans* var. *nigritarsus* Gravenhorst); same locality, August, at angelica *Angelica*, WFJ (Johnson, 1922b: p. 69 as *Homocidus elegans* var. *rufonotatus* Holmgren); DOWN: Rostrevor, ♂ 25 July 1929, grass plot, WFJ (Johnson, 1930: p. 157 as *Homocidus*. Var. (*fide* Dr A. Roman); LOUTH: Bellurgan, ♂ June 1916, among herbage on seashore, WFJ (Johnson, 1917a: p. 39 as *Homocidus elegans* var. *nigritarsus*).

***Syrphoctonus fissorius* (Gravenhorst, 1829)**

ARMAGH: Poyntzpass hill, {21} June {1913}, WFJ (NMI) (Johnson, 1914a: p. 66 as *Homocidus*. Haliday's ms mentions it as common in Ireland); DOWN: Rostrevor, ♀ 5 July {1927}, WFJ (NMI) (Johnson, 1929: p. 137 as *Homocidus*).

Ireland (Morley, 1911b: p. 99 as *Homocidus*. Haliday claims, in MS. in Dublin Museum, to have found it commonly in Ireland; Beirne, 1941a: p. 687 as *Diplazon*. ♂♀).

***Syrphoctonus gracilentus* (Holmgren, 1858)**

WICKLOW: Lough Ouler, on the shore, at 1800ft, {22 August 1937}, AWS (NMI); North Prison on Lugnaquilla, 2200ft {2000}, {20 August 1939}, AWS (NMI) (Stelfox, 1941: p. 118 as *Homocidus*).

Ireland (Beirne, 1941a: p 699 as *Diplazon*. 2♂♂).

***Syrphoctonus haemorrhoidalis* (Szépligeti, 1898)**

synonym *Homotropus tricolor* (Stelfox, 1941)

ANTRIM: Ballygally Head, north-west side, ♀ 25 July 1931, from a field, AWS (Stelfox, 1941: p. 115 as *Homocidus tricolor*); DUBLIN: Harold's Cross, holotype ♀ 14 June 1937, taken on a currant *Ribes* bush in garden, AWS (USNM) (Stelfox, 1941: p. 115 as *Homocidus tricolor*; Fitton, 1976: p. 349 as *Homocidus tricolor*); Slade Brook, at about 1000 ft. altitude, ♂ 15 June 1927, AWS; WICKLOW: Rathdrum, ♀ 8 July 1926, AWS (both Stelfox, 1941: p. 115 as *Homocidus tricolor*).

Ireland (Beirne, 1941a: p. 692 as *Diplazon tricolor*. ♂♀).

***Syrphoctonus impolitus* (Stelfox, 1941)**

LEITRIM: Bundrowse, along left bank of the River Drowse, just inland of the Bundoran-Sligo road, ♂ 1 August 1933, AWS (NMI); WICKLOW: The Quill, near Kilmacanogue, ♂ 28 May 1949, an old oak *Quercus* wood, BPB (NMI) (Stelfox, 1941: p. 117 as *Homocidus*).

Ireland (Beirne, 1941a: p. 699 as *Diplazon*. 2♂♂).

***Syrphoctonus longiventris* (Thomson, 1890)**

DOWN: Rostrevor, ♀ 10 July 1930, garden, WFJ (Johnson, 1931a: p. 54 as *Homocidus*). There are Irish Stelfox specimens in NMI.

Ireland (Beirne, 1941a: p. 695 as *Diplazon*. ♂♀).

***Syrphoctonus megaspis* (Thomson, 1890)**

Ireland (Beirne, 1941a: p. 693 as *Diplazon*. ♂♀).

***Syrphoctonus neopulcher* Horstmann, 1968**

synonym *Homotropus pulcher* misidentification

CARLOW: Cloughristick, ♀ 19 June 1982, JMOC (NMI) (det. MB as *Syrphoctonus*) (unpublished); DONEGAL: Portnoo, cliff, {25} June {1920}, WFJ (NMI) (Johnson, 1921a: p. 106 as *Homocidus pulcher*); DOWN: Dromore, ♀ August 1925, WFJ (NMI) (Johnson, 1927: p. 160 as *Homocidus pulcher* Holmgren); Rostrevor, ♂ 25 July 1929, grass plot, WFJ (Johnson, 1930: p. 157 as *Homocidus tarsatorius*). Corrected by AWS in an annotation to *pulcher*); Warrenpoint, ♂ 10 August {1928}, WFJ (NMI) (Johnson, 1929: p. 137 as *Homocidus tarsatorius* Panz. (correction made by AWS in an annotation). Areolet present in right wing, absent in left).

Ireland (Beirne, 1941a: p. 702 as *Diplazon pulcher*. ♂♀).

***Syrphoctonus nigratarsus* (Gravenhorst, 1829)**

CAVAN: Virginia, ♀ 30 May 1982, JMOC (NMI) (det. MRB) (unpublished); DOWN: Rostrevor, ♂ 2 July, WFJ; Warrenpoint, ♀ 20 August, WFJ (NMI) (Johnson, 1929: p. 137 as *Homocidus*); DUBLIN: St John's Wood, Clondalkin, ♀♀ 3-17 July 1982, Malaise trap, JMOC (NMI) (det. MRB); KERRY: Torc Stream, Killarney, ♀ 10

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

September 1981, JPOC (NMI) (det. MRB) (both unpublished).

Ireland (Beirne, 1941a: p. 701 as *Diplazon*. ♂2♀♀; Townes *et al.*, 1965: p. 404).

***Syrphoctonus pallipes* (Gravenhorst, 1829)**

DONEGAL: Coolmore, ♂ 14 September 1916, WFJ (NMI) (det. AWS as *Homotropus*).

Ireland (Beirne, 1941a: p. 703 as *Diplazon*. 2♀♀; Jussila, 1965: p. 119 as *Homotropus*; Jussila, 1976: p. 24 as *Homotropus*).

***Syrphoctonus pictus* (Gravenhorst, 1829)**

ARMAGH: Poyntzpass, field and hill, June and July, at hogweed *Heracleum*, WFJ (NMI) (Johnson, 1914a: p. 66 as *Homocidus*; Johnson, 1921a: p. 106 as *Homocidus*. Holmgren's var. 1, with scutellum entirely black); same locality, 31 July, emerged...from pupa on a blackberry leaf, which Mr Moley tells me is that of a syrphid, WFJ (Johnson, 1914a: p. 66 as *Promethus scutellaris*) (re-identified as *Homocidus pictus* by AWS); DONEGAL: Coolmore, among willows *Salix*, WFJ (Johnson, 1915: p. 132); DOWN: Dromore, ♂ August 1925, WFJ; Rostrevor, ♀ September 1923, WFJ (NMI) (Johnson, 1927: p. 160 as *Homocidus*); same locality, ♀ 7 August 1929, field opposite, 4 September 1929, in house, WFJ (Johnson, 1930: p. 157 as *Homocidus*); Newcastle, ♀♀ 10 August and 22 September, WFJ (Johnson, 1929: p. 137 as *Homocidus*); LOUTH: Carlingford, June 1921, WFJ (NMI) (Johnson, 1922a: p. 17 as *Homocidus*); MAYO: Sraheens Lough, Achill, ♀ June, WFJ (Morley, 1911a: p. 8 as *Stenichneumon*).

Ireland (Beirne, 1941a: p. 693 as *Diplazon*. 9♂♂4♀♀; Kerrich, 1949: p. 5 as *Diplazon*. A. W. Stelfox writes that the coxae are often black in *pictus* Grav. auctt., and this is true for Irish specimens in the British Museum series; Jussila, 1965: p.118).

***Syrphoctonus signatus* (Gravenhorst, 1829)**

synonym *Homotropus hygrobis* (Thomson, 1890)

[ARMAGH: Poyntzpass, September, field, WFJ (NMI) (misidentified according to Stelfox) (Johnson, 1922b: p.69 as *Homocidus*)]; [DONEGAL: Coolmore, on sandhills at thistles *Carduus*, WFJ (NMI) (misidentified according to Stelfox) (Johnson, 1915:

EUCEROTINAE

The subfamily comprises a single genus, *Euceros*, world-wide in distribution, with about 45 species. Three species occur in the British Isles. Male *Euceros* can be

recognized easily by the flattened and widened antennal segments. This character is less well developed in females.

Species of *Euceros* are hyperparasites and they have an extraordinary and complex life-history, quite unlike that of any other ichneumonids. Female *E. frigidus* lay stalked eggs in groups on the pine foliage, near to the sawfly larvae. The egg stalk is chorionic like that of Tryphoninae and is attached by a cup-like, presumably sticky, structure to the plant. Compared to other ichneumonids the ovipositor of *Euceros* is very feeble. The first larval instar is a 'planidium' which uses the egg stalk as a platform from which it can transfer to a passing sawfly larva. This primary host larva serves as a carrier and source of nutrition, but no further development takes place unless it is parasitized by another ichneumonid. The two adaptations needed to ensure the success of this hazardous strategy are the production of an adequate number of eggs and the timing and location of oviposition. In *E. frigidus* the female has the exceptionally large number of about 100 ovarioles and this corresponds well to the number of eggs laid in a single cluster. Estimates of total fecundity range from 900 to 5000. The egg clusters extended over about 15 cm of foliage starting about 11 cm from the colonies of young sawfly larvae. The sawfly larvae proceed towards the *Euceros* eggs as they feed and their passage through the cluster occurs just after the eggs have hatched.

The planidium comes to rest in an integumental fold on the carrier host and attaches itself using its mouthparts. Before attachment has taken place planidia can transfer from one sawfly larva to another. Just prior to each host ecdysis the planidium passes through the old integument and re-attaches itself, maintaining the same position on the host. Within the cocoon spun by the mature sawfly larva the planidium transfers to its true host, the larva of a primary ichneumonid parasite of the sawfly. The primary parasite larva survives to become fully-grown and to spin its own cocoon, within which the *Euceros* spins its flimsy cocoon and pupates. Of course, the carrier host is not always parasitized by a primary parasite and in such cases the planidium transfers to the pupa and eventually to the adult but fails to develop further.

The primary hosts with which *Euceros* species are associated include Lepidoptera as well as sawflies. The primary ichneumonid parasites which act as hosts include ectophagous and endophagous species, of the subfamilies Anomaloninae, Banchinae, Campopleginae, Ctenopelmatinae, Ophioninae, Cryptinae and Tryphoninae (Phytodietini). There are also a few records from braconid primary parasites. All *Euceros* species seem to be associated with primary hosts on trees and shrubs (angiosperms and gymnosperms) and the available data suggest that the north temperate species, at least, are all univoltine.

Ireland (Townes *et al.*, 1965: p. 118; Fitton, 1984a: p. 190).

ICHNEUMONINAE

The large subfamily Ichneumoninae includes a relatively large proportion of large, colourful species and it has always attracted more attention from taxonomists and amateur entomologists than other subfamilies. On a world scale this means that it is better known than any other large subfamily, with almost 4,300 described species. The Ichneumoninae comprises about 15% of the British Isles ichneumonid fauna.

Ichneumonines are solitary internal idiobiont or koinobiont parasites of Lepidoptera, with oviposition almost always into the pupa or final larval instar, respectively, and adult emergence always from the host pupa. Females of many groups search for hosts on foot, low down in the undergrowth or in the litter layer. Some have fossorial fore limbs and may tunnel into loose soil; those which oviposit only into fresh pupae apparently locate them by following the ephemeral scent trail

left by the host larva as it burrowed into the ground. A few species are known to oviposit into immature larvae, for example, the females of *Limerodops elongatus* (Brischke) use their specialized elongate metasoma to reach the early larval instars of *Hadena gemina* Hübner hidden in their protective webs in the inflorescences of certain grasses. Most European species are univoltine. Fertilized females of some groups hibernate in tree stumps, and similar situations during the winter. Other species overwinter as a first instar larva in the fatty tissue of the host pupa, and these species are often bivoltine and may parasitize different host species in the spring and autumnal generations. The egg may be deposited free in the host haemocoel or may be placed more precisely, for example, in *Poecilostictus cothurnatus* (Gravenhorst) in wall of the hind gut. Females of some species feed on host pupae.

MRB and RN); Dane's Wood, Clandeboye

Estate, ♂ 25 August 1975, swept vegetation, AGI (UM) (det. JPB, *vide* MRB) (both unpublished); Rostrevor, ♂ September 1923, WFJ (NMI) (Johnson, 1927: p. 158); Tollymore, ♀ 21 August 1984, mixed deciduous woodland (oak *Quercus* and beech *Fagus*), MRB and RN (UM) (det. MRB and RN) (unpublished); FERMANAGH: Summer Hill, ♀ 14 December 1905, WFJ (NMI) (Johnson, 1907: p. 246; Morley, 1907b: p. 160); MAYO: Achill Sound, June 1910, WFJ (NMI); Belclare, ♀ July 1910, JNH (NMI) (Morley, 1911a: p. 9); TYRONE: Knockmany Forest, ♀ 18 May 1983, MRB (UM) (unpublished).

Ireland (Boston and Nash, 1989: p. 136 UM).

***Ichneumon gracilicornis* Gravenhorst, 1829**

ARMAGH: Poyntzpass, July, in field, at Umbelliferae, WFJ (NMI) (Johnson, 1916a: p. 19); DONEGAL: Coolmore, on roadside, WFJ (Johnson, 1915: p. 130); DOWN: Rostrevor, ♀ September 1923, WFJ (NMI) (Johnson, 1927: p. 158); Warrenpoint, ♂ 24 August, WFJ (NMI) (Johnson, 1929: p. 135); KERRY (South): no locality, ♀ June 1902, well-marked example (Saunders *et al.*, 1903: p. 68); Rossbeigh, June, HD (Morley, 1903: p. 144).

[*Ichneumon gratus* Wesmael, 1855

DOWN: Newcastle, ♂ 25 May, WFJ (Johnson, 1929: p. 135; Perkins, 1953: p. 128 this specimen is a female of *Chasmias motatorius*).]

***Ichneumon haemorrhoidicus* Kriechbaumer, 1887**

synonym *Ichneumon albicollis* Wesmael, 1857

DOWN: Rostrevor, ♂ 15 August 1929, in a field, WFJ (NMI) (Johnson, 1930: p. 156).

***Ichneumon haglundii* Holmgren, 1864**

LOUTH: Termonfeckin, ♂ August 1924, WFJ (NMI) (Johnson, 1927: p. 158).

***Ichneumon inquinatus* Wesmael, 1845**

MAYO: Sraheens Lough, ♀ June 1910, WFJ (Morley, 1911a: p. 9).

***Ichneumon insidiosus* Wesmael, 1844**

ARMAGH: Poyntzpass, January and May, roadside and in moss in wood, WFJ (NMI) (Johnson, 1920c: p. 66; Johnson, 1921a: p. 105); DONEGAL: Coolmore, August

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

1912, WFJ (NMI) (Johnson, 1913: p. 139); FERMANAGH: Summer Hill, ♀ 14 December 1905, moss on lawn, WFJ (Johnson, 1907: p. 246; Morley, 1907b: p. 160; Johnson, 1920c: p. 66).

***Ichneumon ligatorius* Thunberg, 1824**

synonym *Ichneumon gradarius* Wesmael, 1848

MONAGHAN: Scotstown, ♀ 15 March 1894, in moss, WFJ (det. CM) (Johnson, 1904a: p. 256 as *Ichneumon gradarius*; Johnson, 1904b: p. 262 as *Ichneumon gradarius*; Johnson, 1920c: p. 66 as *Ichneumon gradarius*).

***Ichneumon melanotis* Holmgren, 1864**

synonym *Ichneumon macrocerus* Thomson, 1886

ANTRIM: Belfast, ♀ July 1983, RP (UM) (det. MRB) (unpublished); ARMAGH: Poyntzpass, November, in moss, WFJ (NMI) (Johnson, 1913: p. 139); DONEGAL: Portnoo, September 1917, at wild carrot *Daucus carota*, uncommon, WFJ (NMI) (Johnson, 1918: p. 107); DOWN: Rostrevor, ♀ 16 May 1929, woods, ♂ 15 July 1929, mill, WFJ (NMI) (Johnson, 1930: p. 156 as *Ichneumon macrocerus*); Warrenpoint, ♂ 24 July, WFJ (NMI) (Johnson, 1929: p. 135 as *Ichneumon macrocerus*).

Ireland (Boston and Nash, 1989: p. 136 UM).

***Ichneumon memorator* Wesmael, 1845**

DOWN: Warrenpoint, ♂ 10 August 1929, WFJ (NMI) (det. WFP) (unpublished); MAYO: Carrowmore Lough, ♂ (Morley, 1911a: p. 9).

***Ichneumon molitorius* Linnaeus, 1761**

DUBLIN: Santry Demense, ♀ February 1903, JNH (NMI) (Morley, 1911c: p. 20; Anon., 1913: p. 43); LOUTH: Termonfeckin, ♀ August 1924, WFJ (NMI) (Johnson, 1927: p. 158).

***Ichneumon oblongus* Schrank, 1802**

synonym *Ichneumon latrator* Fabricius, 1781 misidentification

ANTRIM: Killead, August 1923, WFJ (NMI) (Johnson, 1927: p. 158 as *Ichneumon latrator*); ARMAGH: Poyntzpass, ♀♀ 19 November 1904 and ♀ 8 March 1906, in moss, including var. *means* Gravenhorst, WFJ (NMI) (Johnson, 1907: p. 246 as

Ichneumon latrator; Morley, 1907b: p. 159 as *Ichneumon latrator*); same locality, January, February and March, moss in wood, WFJ (Johnson, 1920: p. 66 as *Ichneumon latrator*. Also var. *means* in January); DONEGAL: Coolmore, September 1912 and August 1917, among herbage in a lane, WFJ (NMI) (Johnson, 1913: p. 138 as *Ichneumon latrator*. Including var. *means*; Johnson, 1918: p. 107 var *means*; a variety with the fourth segment entirely red and the sixth white marked); same locality, September, at Umbelliferae, WFJ (NMI) (Johnson, 1916a: p. 18 as *Ichneumon latrator*. A remarkable variety of this common species with the scutellum white (♀)); Portnoo, September, cliff, WFJ (NMI) (Johnson, 1919a: p. 35 as *Ichneumon latrator*. Also var. *means*); DOWN: Greencastle, ♂♀ common, WFJ (NMI) (Johnson, 1931c: p. 139 as *Ichneumon latrator*); Newcastle, 17 August, WFJ (Johnson, 1929: p. 135 as *Ichneumon latrator*); Rostrevor, July 1922, garden, WFJ (Johnson, 1923: p. 38 as *Ichneumon latrator*); same locality, 23 and 27 July, WFJ (NMI) (Johnson, 1929: p. 135 as *Ichneumon latrator*); Warrenpoint, ♂ 24 July, WFJ (Johnson, 1929: p. 135 as *Ichneumon latrator*); FERMANAGH: Summer Hill, ♀♀ 14 December 1905, including var. *means*, WFJ (NMI) (Johnson, 1907: p. 246 as *Ichneumon latrator*; Morley, 1907b: p. 159 as *Ichneumon latrator*); same locality, December, moss on lawn (Johnson, 1920: p. 66 as *Ichneumon latrator*); LOUTH: Termonfeckin, August 1924, WFJ (NMI) (Johnson, 1927: p. 158 as *Ichneumon latrator*); MAYO: Achill, ♀, JNH (as var. *means* Grav.); Carrowmore Lough, ♂ July, on reeds, CM (Morley, 1911a: p. 9 as *Ichneumon latrator*).

Ireland (Boston and Nash, 1989: p. 136 as *Ichneumon latrator*. UM).

***Ichneumon primatorius* Forster, 1771**

ARMAGH: Poyntzpass field, ♂♂ September and October, WFJ (Johnson, 1920a: p. 8); WATERFORD: Tramore, ♀ July, LHBW (NMI) (Johnson, 1914a: p. 65; Johnson, 1920a: p. 8); WEXFORD: Kilmore, ♂, Bignell Collection (Perkins, 1953: p. 120 this specimen had been misidentified as *Protoichneumon fusorius*).

***Ichneumon sarcitorius* Linnaeus, 1758**

ANTRIM: Killead, August 1923, WFJ (NMI) (Johnson, 1927: p. 158, ♂♀);

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

ARMAGH: Poyntzpass, field and hill, May and July, WFJ (NMI) (Johnson, 1914a: p. 65; Johnson, 1920a: p. 8; Johnson, 1921a: p. 105 Dr Roman remarks that the bands on the abdomen of the male which in our specimens are stramineous or flavous are in Sweden white); same locality, August, at flowers of angelica *Angelica*, WFJ (Johnson, 1916a: p. 18 among these was a female with the head entirely black); CORK: Garnish Island, Glengarriff, ♂ 1 July 1985, swept in ornamental garden, JMOC (NMI) (det. MRB) (unpublished); DONEGAL: Coolmore, ♂ September 1916, captured on the outside wall of the bungalow, WFJ (Johnson, 1917a: p. 38); Portnoo, September 1917, among willows *Salix*, WFJ (Johnson, 1918: p. 107); same locality, ♂ bred from the grey *Dianthecia caesia* (now *Hadena caesia mananii* (Gregson)) (Lepidoptera: Noctuidae), CL (Johnson 1919a: p. 35); Portnoo cliff, June, WFJ (Johnson, 1920a: p. 8); DOWN: Castleward, ♂ 24 July 1985, field with bramble *Rubus*/gorse *Ulex* scrub, MRB (UM); Down Cathedral, ♀ 22 June 1985, feeding on hogweed *Heracleum* in a lane, RA (UM) (det. MRB) (both unpublished); Dundrum, June and July 1926, WFJ (NMI) (Johnson, 1927: p. 158); Greencastle, ♂ 27 August 1930, shore near pier, ♀ 16 August 1930, sandhills, WFJ (NMI) (Johnson, 1931c: p. 139); Horse Island, 5 September 1985, RN and MRB (UM) (det. MRB); Newcastle, August 1926, WFJ; River Quoile near Downpatrick, ♂ collected 25 July 1971, emerged from pupa collected 9 August 1971, RN (UM) (det. JPB) (both unpublished); Rostrevor, June 1923, July 1922, August 1922 and September 1923, WFJ (NMI) (Johnson, 1923: p. 36 I took a male...with the apical bands of the abdominal segments nearly as white as those of Swedish specimens. p. 38; Johnson, 1927: p. 158 ♂♀. I took a male at Rostrevor with the abdominal bands pure white); Warrenpoint, 25 August, WFJ (Johnson, 1929: p. 135); KERRY: Kenmare, ♀ 4 July 1901, JWY (Morley, 1902: p. 54 as *Coelichneumon*); Morley, 1903: p. 115); LOUTH: Termonfeckin, August and September 1924, WFJ (NMI) (Johnson, 1927: p. 158, ♂♀); WEXFORD: Kilmore, AB (Morley, 1903: p. 115).

Ireland (Boston and Nash, 1989: p. 136 UM).

***Ichneumon simulans* Tischbein, 1873**

synonym *Ichneumon subquadratus* Thomson, 1887

ARMAGH: Poyntzpass, 3♀♀ 14 December 1905, in moss, WFJ (Morley, 1907b: p. 160 as *Ichneumon subquadratus*); same locality, August and November, in moss, WFJ (Johnson, 1913: p. 139 as *Ichneumon subquadratus*); same locality, January, moss on lawn, WFJ (NMI) (Johnson, 1920: p. 66 as *Ichneumon subquadratus*); DOWN: Newcastle, ♂ 27 July {1927}, WFJ (NMI) (Johnson, 1929: p. 135 as *Ichneumon subquadratus*); Rostrevor, ♂ 5 July 1930, in field opposite house, WFJ (NMI) (Johnson, 1931a: p. 53); FERMANAGH: Summer Hill, {14} December {1905}, moss on lawn, WFJ (NMI) (Johnson, 1907: p. 246 as *Ichneumon subquadratus*; Johnson, 1920: p. 66 as *Ichneumon subquadratus*); LOUTH: Carlingford, June 1921, WFJ (Johnson, 1922a: p. 17 as *Ichneumon subquadratus*); Termonfeckin, ♂ August 1924, WFJ (NMI) (Johnson, 1927: p. 158 as *Ichneumon subquadratus*); TYRONE: Moy, ♀ 2 June 1985, hawthorn *Crataegus*, herbaceous verge, MRB (UM) (det. MRB) (unpublished).

Ireland (Boston and Nash, 1989: p. 136 as *Ichneumon subquadratus*. UM).

***Ichneumon spurius* Wesmael, 1848**

DONEGAL: Portnoo, ♀ {18} September {1918}, cliff, WFJ (NMI) (Johnson, 1919a: p. 35).

***Ichneumon stigmatorius* Zetterstedt, 1838**

synonym *Ichneumon walkeri* Wesmael, 1848

ANTRIM: Rea's Wood, ♀ 11 September 1985, Malaise trap in deciduous woodland with marshy patches, MRB and RN (UM) (Boston and Nash, 1989: pp 135 as *Ichneumon walkeri*); WICKLOW: Seefin, ♀ 23 October 1938, AWS (NMI) (det. JFP as *Ichneumon walkeri*) (unpublished).

Ireland (Boston and Nash, 1989: p. 136 UM as *Ichneumon walkeri*).

***Ichneumon stramentarius* Gravenhorst, 1820**

Ichneumon stramentarius septentrionalis Holmgren, 1864

ANTRIM: Dunmurry, ♀ September 1984, TD (UM) (Boston and Nash, 1989: p. 135 as *Ichneumon septentrionalis*); ARMAGH: Poyntzpass, {26 August 1909}, WFJ

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

(NMI) (Johnson, 1912a: p. 77); same locality, August, in fields at angelica *Angelica*, not common, WFJ (NMI) (Johnson, 1914a: p. 65); DONEGAL: Coolmore, September, among willows *Salix*, WFJ (NMI) (Johnson, 1915: p. 130; Johnson, 1916a: p. 18); DOWN: Bangor, Stricklands Glen, ♀ 1969, CR (Boston and Nash, 1989: p. 135 as *Ichneumon septentrionalis*); Lough Shark, WFJ (NMI) (Johnson, 1912a: p. 77); Newcastle, 29 June {1927}, WFJ (NMI) (Johnson, 1929: p. 135); Rostrevor, ♀ June 1924, WFJ (NMI) (Johnson, 1927: p. 158); same locality, 28 July, WFJ (Johnson, 1929: p. 135); GALWAY: Garryland Wood, ♀ 20 August 1985, in moss on rocks, dense woodland, RA (UM) (Boston and Nash, 1989: p. 135 as *Ichneumon septentrionalis*).

Ireland (Boston and Nash, 1989: p. 136 as *Ichneumon septentrionalis*. UM).

***Ichneumon submarginatus* Gravenhorst, 1829**

DONEGAL: Coolmore, ♂ August 1917, among willows *Salix*, WFJ (Johnson, 1918: p. 107).

***Ichneumon suspiciosus* Wesmael, 1845**

ANTRIM: Belfast (Botanic Gardens), ♂ 4 May 1975, RN (UM) (det. MRB) (unpublished); ARMAGH: Poyntzpass, August, at angelica *Angelica*, WFJ (NMI) (Johnson, 1916a: p. 18); same locality, January, moss in wood, WFJ (Johnson, 1920c: p. 66); Poyntzpass, Acton Wood, roadside, May, WFJ (Johnson, 1921a: p. 105); DONEGAL: Coolmore 1912, September, WFJ (NMI) (Johnson, 1913: p. 13); same locality, on the roadside, WFJ (Johnson, 1915: p. 130); same locality, September, in porch of the bungalow, WFJ (NMI) (Johnson, 1916a: p. 18); DOWN: Dundrum, June 1926, WFJ (Johnson, 1927: p. 158 ♀); Greencastle, ♂ 24 August 1930, roadside, WFJ (Johnson, 1931c: p. 140); Holywood {1909, ALO} (NMI) (Johnson, 1912a: p. 77); Rostrevor, ♀ October 1925, flew into house, WFJ (Johnson, 1927: p. 158 ♀); same locality, ♂ 12 July 1929, grass plot, ♂ 14 September 1929, WFJ (Johnson, 1930: p. 156); Warrenpoint, ♂ 27 August {1928}, WFJ (NMI) (Johnson, 1929: p. 135); LOUTH: Carlingford, June 1921, WFJ (NMI) (Johnson, 1922a: p. 17); MAYO: Sraheens Lough, ♀♀ June 1910, WFJ (Morley, 1911a: p. 9); TYRONE:

Drumagullion, near Stewartstown, ♀ 25 March, in hibernation, under a stone in a field, NHF (Johnson, 1918: p. 107; Johnson, 1920c: p. 66 taken by the late H. L. Orr); same locality, December, under a stone, WFJ (Johnson, 1920c: p. 66).

Ireland (Boston and Nash, 1989: p. 136 UM).

***Ichneumon terminatorius* Gravenhorst, 1820**

ANTRIM: Magheramore, 5 April 1910, HLO (Johnson, 1912a: p. 77; Johnson, 1920c: p. 66); ARMAGH: Poyntzpass, field, August, at angelica *Angelica*, WFJ (NMI) (Johnson, 1916a: p. 18; Johnson, 1921a: p. 105); KERRY (South): Rossbeigh, June 1902, Donisthorpe (Saunders *et al.*, 1903: p. 68; Morley, 1903: p. 130; Johnson, 1912a: p. 77); LOUTH: Edentubber, 2♀♀ 5 April 1906, moss from high ground, WFJ (Johnson, 1907: p. 246; Morley, 1907b: p. 160; Johnson, 1920c: p. 66); Termonfeckin, ♀ August 1924, WFJ (NMI) (Johnson, 1927: p. 158).

****Ichneumon tuberculipes* Wesmael, 1848**

New to Ireland

WEXFORD: Clone, ♂ 9 August 1930, AWS (NMI) (det. JFP).

****Ichneumon validicornis* Holmgren, 1864**

New to Ireland

WICKLOW: Arklow District, ♂ 2 August 1925, AWS (NMI) (another voucher specimen det. AR).

****Ichneumon vulneratorius* Zetterstedt, 1838**

New to Ireland

SLIGO: Ballymote, {GHC} (NMI).

***Ichneumon xanthorius* Forster, 1771**

ARMAGH: Poyntzpass, June, in stable window, WFJ (Johnson, 1915: p. 130); Poyntzpass hill, May, WFJ (NMI) (Johnson, 1920a: p. 8); DONEGAL: Coolmore, on the roadside among herbage, WFJ (NMI) (Johnson, 1915: p. 130); Portnoo, September 1917, among heather *Calluna vulgaris*, cliff, WFJ (Johnson, 1918: p. 107 var. *flavoniger* Gravenhorst; Johnson, 1919a: p. 35); DOWN: Dundrum, July and August 1926, WFJ (NMI) (Johnson, 1927: p. 158 as *Amblyteles*); Murlough NNR, ♂ June 1976, sand dunes, RN (UM) (det. MRB and RN) (unpublished); Newcastle, ♂ 25 August, WFJ (Johnson, 1929: p. 135 as *Amblyteles*); Rostrevor, Victoria Square, ♂ 17 August 1929, WFJ (NMI); same locality, ♂ 26 August 1929, var. *flavoniger*

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

Gravenhorst, grass plot, WFJ (both Johnson, 1930: p. 156); LOUTH: Carlingford, July, WFJ (NMI) (Johnson, 1913: p. 138).

Ireland (Boston and Nash, 1989: p. 136 UM).

***Limerodes arctiventris* (Schiødte, 1839)**

synonym *Limerodes arctiventris* (Boie, 1841) preoccupied

DOWN: Greencastle, ♀ 24 August 1930, on the roadside, WFJ (NMI) (Johnson, 1931c: p. 140 as *Limerodes arctiventris* (Boie)).

***Limerodops elongatus* (Brischke, 1865)**

ANTRIM: Rea's Wood, ♂ August 1976, on umbels, fenny lakeshore, RA (UM) (Boston and Nash, 1989: p. 135).

Ireland (Boston and Nash, 1989: p. 136 UM).

***Limerodops subsericans* (Gravenhorst, 1820)**

DONEGAL: Coolmore, ♀♀ September, among tallows *Salix* on the roadside, WFJ (NMI) (Johnson, 1916a: p. 19 both remarkable forms. One has the scutellum black with a white spot to either side; the other is remarkably large and stout and has the scape of the antennae dark red below, the first and second joints of flagellum black, the following ten wholly or partly white and the remainder black (Johnson, 1916a: p. 19 as *Amblyteles*); Portnoo, ♀, freshly emerged on bell heather *Erica cinerea*, WFJ (NMI) (Johnson, 1919a: p. 35 as *Amblyteles*); DOWN: Greencastle, ♀ 22 August 1930, roadside, WFJ (NMI) (Johnson, 1931c: p. 140 var. with scutellum and hind body entirely black); Newcastle, ♀ 17 August, WFJ (NMI) (Johnson, 1929: p. 135 as *Amblyteles*); Murlough NNR, ♂ 10 June 1975, sand dunes, RN and HCGC (UM) (det. MRB and RN) (unpublished); LOUTH: Carlingford 1921, June, WFJ (NMI) (Johnson, 1922a: p. 15 as *Amblyteles*. An uncommon form, having the scutellum entirely black, p. 17); MAYO: Westport, ♀ July 1911, JNH (NMI) (Morley, 1911a: p. 9 as *Amblyteles*).

Ireland (Boston and Nash, 1989: p. 136 UM).

[*Melanichneumon albipictus* (Gravenhorst, 1820)

DOWN: Rostrevor, ♀ 6 September 1930, in greenhouse, WFJ (Johnson, 1931a: p. 53

as *Ichneumon*. Var. *obsoletus* Berthoumieu. A form with scutellum and segments 1-5 of hind body black; Perkins, 1953: p. 123 misidentification of *Barichneumon gemellus*.)]

[*Patrocloides sputator* (Fabricius, 1793)

DOWN: Dundrum, ♂ August 1926, WFJ (Johnson, 1927: p. 158 as *Ctenichneumon sputator*; Perkins, 1953: p. 129 the specimens named *sputator* in the Johnson collection are males of *Stenichneumon culpator*); Rostrevor, ♂♂ 6 and 7 August 1929, field opposite, WFJ (Johnson, 1930: p. 156 as *Ctenichneumon sputator* var. *nigriventris* Berthoumieu; Perkins, 1953: p. 129 the specimens named *sputator* in the Johnson collection are males of *Stenichneumon culpator*.)]

***Platylabops apricus* (Gravenhorst, 1820)**

ANTRIM: Rea's Wood, ♂ 25 September 1984, Malaise trap in deciduous woodland with marshy patches, MRB and RN (UM) (Boston and Nash, 1989: p. 135).

Ireland (Boston and Nash, 1989: p. 136 UM).

***Platylabops lariciatae* (Kriechbaumer, 1890)**

DOWN: Donard Lodge, Newcastle, ♂♂ 25 July and ♂ 8 August 1965 (NMI), in a larch *Larix* plantation, AWS (conf. JFP); Drinnahilly, ♂ 1 August 1965, in larch *Larix* plantation, AWS (Stelfox, 1966c: p. 242 as *Platylabus*).

****Platylabops virginalis* (Wesmael, 1845)**

New to Ireland

DOWN: Rostrevor, ♂ 5 August 1924, WFJ (NMI) (det. AR as *Barichneumon*).

***Probolus alticola* (Gravenhorst, 1820)**

ARMAGH: Poyntzpass hill and field, June and September, WFJ (NMI) (Johnson, 1914a: p. 65; Johnson, 1920a: p. 8); DONEGAL: Coolmore, 2♂♂ on the wing and 3♀♀ among herbage on a grassy bank, September 1916, WFJ (NMI) (Johnson, 1917a: p. 38); Portnoo, September, WFJ (NMI); FERMANAGH: Tempo, CL (both Johnson, 1919a: p. 35).

***Probolus crassulus* Horstmann, 2000**

synonym *Probolus concinnus* Wesmael, 1853

DOWN: Inch Abbey, River Quoile, ♂ 22 June 1985, swept from dock *Rumex*, river

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

bank, RA (UM) (det. MRB as *Probolus concinnus*) (unpublished); KERRY: Parknasilla, ♀ 14 July 1901, JWY (Morley, 1902: p. 54 as *Probolus concinnus*; Morley, 1903: p. 213 as *Probolus concinnus*).

Ireland (Boston and Nash, 1989: p. 136 as *Probolus concinnus*. UM).

***Probolus culpatorius* (Linnaeus, 1758)**

DOWN: Greencastle, ♂ 16 August 1930, sandhills, WFJ (Johnson, 1931c: p. 140 as *Amblyteles culpatorius* var. *oblongatus* Tischb.); Rostrevor, ♂ 1 September 1930, in a field near the woods, WFJ (Johnson, 1931a: p. 53 as *Amblyteles*).

***Spilichneumon celenae* Perkins, 1953**

WICKLOW: Tonlagee Mountain (Mt.), 2♂♂ (allotype and paratype) 22 August 1937, AWS and GMS (BMNH) (Perkins, 1953: p. 151).

Ireland (Perkins, 1953: p. 151 ♀ (holotype) ex Haworth's minor *Celaena* [*Celena*] *haworthii* (Curtis) (Lepidoptera: Noctuidae), 1884, W. V. de F. Kane (should read W. F. de V. Kane) (BMNH); Fitton, 1976: p. 348 holotype ♀...(BMNH)).

***Spilichneumon johansonii* (Holmgren, 1871)**

DOWN: Balleevy, ♀ 11 May 1985, MRB (UM); TYRONE: Altmore Burn, ♀ 24 June 1985, MRB (UM); near Moy, ♂ 14 July 1985, hawthorn *Crataegus*, herbaceous verge, MRB (UM) (all Boston and Nash, 1989: p. 135 as *Triptognathus*).

Ireland (Boston and Nash, 1989: p. 136 as *Triptognathus*. UM).

***Spilichneumon occisorius* (Fabricius, 1793)**

ARMAGH: Poyntzpass, July, field at hogweed *Heracleum*, WFJ (Johnson, 1922b: p. 69 var. *nigrinus* Berth.); DONEGAL: Coolmore, ♂, on the roadside among willows *Salix*, WFJ (Johnson, 1915: p. 130); DOWN: Dromore, ♂ August 1925, WFJ (NMI); Murlough NNR, 2♂♂ 31 August 1984, BHN (UM) (det. MRB) (unpublished); Rostrevor, September 1922, WFJ (NMI) (Johnson, 1923: p. 38); Rostrevor, at Killowen, September 1925, many at flowery bank along the beach, WFJ (NMI) (both Johnson, 1927: p. 158 ♂); at Killowen beach, ♂ 29 August 1929, at wild carrot *Daucus carota*, Maureen Smyth (Johnson, 1930: p. 156).

Ireland (Boston and Nash, 1989: p. 136 UM).

***Spilothyrateles nuptatorius* (Fabricius, 1793)**

synonym *Spilothyrateles fabricii* (Schrank, 1802)

ARMAGH: Poyntzpass, June, July and October, in stable window and on Umbelliferae in fields, WFJ (NMI) (Johnson, 1915: p. 130 as *Spilichneumon fabricii*); same locality, ♂♂♀♀ June, in stable window, WFJ (NMI) (Johnson, 1916a: p. 19 as *Spilichneumon fabricii*); DOWN: Greencastle, ♀ 16 August 1930, sandhills, ♀ 27 August 1930, shore near pier, WFJ (NMI) (Johnson, 1931c: p. 140 as *Spilichneumon fabricii*).

****Stenaoplus pictus* (Gravenhorst, 1829)****New to Ireland**

synonym *Aoplus ratzeburgii* (Hartig, 1838)

DUBLIN: Glenasmole, ♀ 14 April 1937, AWS (NMI) (det. JFP as *Aoplus ratzeburgii*).

***Stenichneumon culpator* (Schrank, 1802)**

ARMAGH: Poyntzpass hill, {8} July {1919}, a melanic form of the male, WFJ (NMI) (det AR) (Johnson, 1920a: p. 8); Poyntzpass, {20} December {1919}, moss on pine *Pinus* stump, WFJ (NMI) (Johnson, 1920c: p. 65); DOWN: Dundrum, July 1926, WFJ (NMI) (Johnson, 1927: p. 158 ♂♀); same locality, ♂ August 1926, WFJ (NMI) (det. JFP) (Johnson, 1927: p. 158 as *Ctenichneumon sputator*; Perkins, 1953: p. 129 the specimens named *sputator* in the Johnson collection are males of *Stenichneumon culpator*); Greencastle, ♀ 24 August 1930, roadside, WFJ (Johnson, 1931c: p. 139); Rostrevor, {4} June 1924, in numbers at thistles, WFJ (NMI) (Johnson, 1927: p. 158 ♂♀); same locality, ♂ 4 August 1928, WFJ (Johnson, 1929: p. 135 var. *adventator* Tischb.); same locality, ♂♂ 6 and 7 August 1929, field opposite, WFJ (NMI) (det. JFP as *Stenichneumon culpator*) (Johnson, 1930: p. 156 as *Ctenichneumon sputator* var. *nigriventris* Berthoumieu; Perkins, 1953: p. 129 the specimens named *sputator* in the Johnson collection are males of *Stenichneumon culpator*); Warrenpoint, ♀ 6 July, WFJ (Johnson, 1929: p. 135); same locality, ♂ 17 August, WFJ (Johnson, 1929: p. 135 another var. antennae white-ringed but hind body entirely black); LOUTH: Carlingford, ♀ June 1921, WFJ (NMI) (Johnson, 1922a: p. 15 entirely black, p. 17).

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

Ireland (Boston and Nash, 1989: p. 136 UM).

***Stenobarichneumon basiglyptus* (Kriechbaumer, 1890)**

synonym *Stenobarichneumon incubitor* misidentified

ANTRIM: Rea's Wood, ♂ 2-4 June 1985, Malaise, RN and MRB (UM) (det. MRB) (unpublished); ARMAGH: Poyntzpass, ♂♀ June, August and September 1916, in fields and on hill, WFJ (NMI) (Johnson, 1917a: p. 37 as *Barichneumon incubitor*; Johnson, 1921a: p. 105 as *Barichneumon incubitor*. A male with white scutellum, *teste* Dr A. Roman); DOWN: Tollymore, ♂ 21 August 1984, mixed deciduous woodland ride, RN and MRB (UM) (det. MRB) (unpublished); LOUTH: Termonfeckin, ♂ August 1924, sandhills, WFJ (NMI) (Johnson, 1927: p. 158 as *Barichneumon incubitor*).

Ireland (Boston and Nash, 1989: p. 136 UM).

***Sycaonia foersteri* (Wesmael, 1848)**

ANTRIM: Rea's Wood, ♂ 10 July 1985, swept on edge of track through deciduous woodland, MRB and RN (UM) (Boston and Nash, 1989: p. 135 as *Cratichneumon*); DOWN: Tollymore Park, ♂ 5 July 1961, AWS (NMI) (det. JFP) (unpublished as *Cratichneumon*); Quoile Wood, ♂ 11 August 1976, in undergrowth, RA (Boston and Nash, 1989: p. 135 as *Cratichneumon*).

Ireland (Boston and Nash, 1989: p. 136 as *Cratichneumon*. UM).

****Tricholabus strigatorius* (Gravenhorst, 1829)**

New to Ireland

DUBLIN: Rogerstown, 29 July 1943, AWS (NMI).

[*Triptognathus atripes* (Gravenhorst, 1829)

synonym *Amblyteles uniguttatus* Gravenhorst, 1829

MAYO: {Louisburgh} Carrowmore Lough, ♂, on reeds, CM (det. AWS as surely wrong) (Morley, 1911a: p. 9 as *Amblyteles uniguttatus*).]

***Virgichneumon digrammus* (Gravenhorst, 1820)**

synonym *Barichneumon nudicoxa* (Thomson, 1888)

ANTRIM: Killead, ♂ August 1923, WFJ (Johnson, 1927: p.158 as *Melanichneumon*); DONEGAL: Coolmore, September, on the roadside, rare, WFJ (Johnson, 1914a: p. 65

as *Melanichneumon nudicoxa*).

***Virgichneumon extremator* (Thunberg, 1824)**

synonym *Platylabus albinus* (Gravenhorst, 1829)

DONEGAL: Coolmore, September, among sallows *Salix*, not common, WFJ (Johnson, 1916a: p. 19 as *Platylabus albinus*); DOWN: Rostrevor, ♂ June 1923, WFJ (Johnson, 1927: p. 158 ♂ as *Platylabus albinus*. Var., thorax entirely black. (*exhortator* Fab. sec. Roman); same locality, ♀ 5 July 1930, in field opposite, WFJ (Johnson, 1930: p. 53 as *Platylabus albinus*. *Teste* Dr Roman).

***Virgichneumon faunus* (Gravenhorst, 1829)**

ANTRIM: Belfast, Barnett's Park, ♂ 12 August 1973, RN (det. JPB) (UM) (Boston and Nash, 1989: p. 135 as *Barichneumon*).

Ireland (Boston and Nash, 1989: p. 136 as *Barichneumon*. UM).

***Virgichneumon maculicauda* Perkins, 1953**

synonym *Barichneumon perscrutator* (Wesmael, 1844) preoccupied

LOUTH: Termonfeckin, ♂♀ July, August 1924, numerous, WFJ (NMI) (Johnson, 1927: p. 158 as *Melanichneumon perscrutator*).

***Virgichneumon monostagon* (Gravenhorst, 1820)**

ANTRIM: Killead, August 1923, WFJ (NMI) (Johnson, 1927: p. 158 as *Melanichneumon monastagon*. ♂♀); CLARE: Lahinch, ♂ 22 August 1985, on car bonnet, seafront/sandy pasture, RA (UM) (det. MRB) (unpublished); DONEGAL: Portnoo, September 1917, among sallows *Salix*, rare, WFJ (NMI) (Johnson, 1918: p. 107 as *Melanichneumon monastagon*); DOWN: Dromore, August 1925, WFJ (NMI); Dundrum, July and August 1926, WFJ; same locality, June 1926, var. *luctuosus* Gravenhorst, WFJ (all Johnson, 1927: p. 158 as *Melanichneumon monastagon*. ♂♀); Newcastle, ♂♂ 25 May, 14 June, 25 August and 6 September, WFJ (NMI) (Johnson, 1929: p.135 as *Melanichneumon monastagon* var. *luctuosus*); Rostrevor, ♂ 10 August 1929, river, WFJ (NMI) (Johnson, 1929: p. 156 as *Melanichneumon monastagon* var. *luctuosus*); Warrenpoint, ♂ 10 August, WFJ (Johnson, 1929: p.135 as *Melanichneumon monastagon* var. *luctuosus*); GALWAY: Portumna, ♂4 September

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

1924, RAP (NMI) (det. JFP) (unpublished); [KERRY: Kenmare, ♂ 5 July 1901, JWY (Morley, 1902: p. 54 as *Melanichneumon*)]. This record should be altered to *B. gemellus* (Johnson, 1916a: p. 18).

Ireland (Boston and Nash, 1989: p. 136 UM).

****Vulgichneumon bimaculatus* (Schrank, 1776) New to Ireland**

KERRY: Ballast, Killarney, 16 September 1930, EFB (NMI); Flesk, Killarney, June 1937, EFB (NMI); KILDARE: Rye Water, 3 June 1952, AWS (NMI) (all as *Barichneumon*).

***Vulgichneumon deceptor* (Scopoli, 1763)**

synonym *Barichneumon vestigator* (Wesmael, 1844) preoccupied

DOWN: Newcastle, ♂ 3 September {1927}, hill, on wild carrot *Daucus carota*, WFJ (NMI) (Johnson, 1929: p. 135); MAYO: Mulranny, ♂ July 1910, PEG (Morley, 1911a: p. 9 as *Barichneumon vestigator*).

***Vulgichneumon saturatorius* (Linnaeus, 1758)**

DOWN: Dromore, August 1925, WFJ (NMI); Dundrum, August 1926, WFJ (NMI) (both Johnson, 1927: p. 158 as *Melanichneumon*. ♂♀); Rostrevor, ♂ 13 July 1929, var. hind legs black, in grass plot, 7 August 1929 (NMI), field opposite, 14 August 1929, river, WFJ (Johnson, 1930: p. 156 as *Melanichneumon*); LOUTH: Termonfeckin, August 1924, WFJ (NMI) (Johnson, 1927: p. 158 as *Melanichneumon*, ♂♀); MAYO: Westport, one (specimen) July 1911, JNH (Morley, 1911a: p. 9 as *Melanichneumon*).

Ireland (Boston and Nash, 1989: p. 136 UM).

***Vulgichneumon suavis* (Gravenhorst, 1820)**

synonym *Barichneumon lepidus* (Gravenhorst, 1829)

ARMAGH: Newry, ♀ 1 August 1927, in street, WFJ (NMI) (Johnson, 1929: p. 135 as *Barichneumon lepidus*); Poyntzpass, June, August, in fields, on hill, WFJ (NMI) (Johnson, 1917a: p. 38 as *Barichneumon lepidus*; Johnson, 1919a: p. 34 as *Barichneumon lepidus*; Johnson, 1921a: p. 105 as *Barichneumon lepidus*; Johnson, 1922b: p. 69 as *Barichneumon lepidus*); DONEGAL: Coolmore, {24} September

{1914}, on Umbelliferae, WFJ (Johnson, 1914a: p. 65 as *Barichneumon lepidus*); DUBLIN: Dundrum, June 1926, WFJ; LOUTH: Termonfeckin, July, August and September 1924, WFJ (NMI) (both Johnson, 1927: p. 158 as *Barichneumon lepidus*. ♂♀); WATERFORD: Stradbally, ♂ 22-30 June 1907, HWA (Morley, 1908b: p. 276 as *Barichneumon lepidus*. A specimen with a long streak of pollen firmly affixed to each side of the face, between the scrobes and the clypeus, but not reaching the latter).

Listrodromini

Listrodromus nyctemerus (Gravenhorst, 1820)

DUBLIN: Blackrock/Monkstown, emerged 16 October 2006 from the pupa of a holly blue butterfly *Celastrina argiolus britanna* Verity (Lepidoptera: Lycaenidae) collected late August/early September as a larva on ivy *Hedera*, B. Aldwell (NMI) (unpublished).

Ireland (Yu, 1998: CD-Rom).

Phaeogenini

**Aethecerus discolor* Wesmael, 1845

New to Ireland

KILDARE: Kilkea Park, ♀ 4 July 1937, AWS (NMI) (det. JFP).

Aethecerus dispar Wesmael, 1845

DUBLIN: Murlough National Nature Reserve (J4039), ♂ 9 June 1973, AGI (UM) (Boston and Nash, 1989: p. 135).

Ireland (Boston and Nash, 1989: p. 136 UM).

[*Aethecerus pallicoxa* Thomson, 1891

DUBLIN: Rostrevor, ♂ 8 August 1929, field opposite, WFJ (Johnson, 1930: p. 156 *vide* Dr A. Roman; Perkins, 1953: p. 133 in the Johnson collection the specimen det. Roman as ?*pallicoxa* is a male of *Oiorhinus pallipalpis*); same locality, ♂ 2 July 1930, field opposite, WFJ (Johnson, 1931a: p. 53).]

**Aethecerus placidus* Wesmael, 1845

New to Ireland

DUBLIN: North (N.) Bull, ♀ 26 September 1941, at the roots of marram *Psamma* (now *Ammophila*), EOM (NMI) (det. JFP); WICKLOW: Broad Lough (L.), ♀ 5 June 1949, AWS (NMI) (det. JFP).

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

****Aethecerus rugifrons* Holmgren, 1890**

New to Ireland

DOWN: Rostrevor, 5 August 1929, mountain, WFJ (NMI).

***Centeterus confector* (Gravenhorst, 1829)**

ANTRIM: Cave Hill, ♂, HLO (Johnson, 1912a: p. 78).]

LYCORININAE

This subfamily comprises only about 30 species. All are now placed in a single genus, *Lycorina*, world-wide in distribution. There is one species in Europe. The pattern of grooves on the metasomal tergites is very characteristic, although the beginner might be confused by other ichneumonids, such as Glyptini (Banchinae) and some pimelines, which have strong diagonal grooves on the tergites. The recorded hosts of *Lycorina* species are Lepidoptera of the families Gelechiidae, Pyralidae and Tortricidae. Most of the hosts seem to be species with larvae which construct leaf rolls or similar shelters. The cocoon is cylindrical with rounded ends, transparent, and very thin and soft. The exit hole is at the end.

****Lycorina triangulifera* Holmgren, 1859**

WICKLOW: Deputy's Pass, 19 July 1929, AWS (NMI).

MESOCHORINAE

This is a moderately large subfamily with relatively few genera, but more than 650

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

described species. Taxonomically the group is poorly known and there are large numbers of species, especially of *Mesochorus*, awaiting proper discrimination and description. About 50 species, representing four genera, comprise the 'British list'.

As information accumulates it seems more certain that, with the possible exception of one genus, all species of Mesochorinae are obligatory, endophagous hyperparasites. The hosts of mesochorines are larvae of other Ichneumonidae and Braconidae (Hymenoptera) or, less frequently, Tachinidae (Diptera) attacking a range of primary hosts, but mainly Lepidoptera. Other primary hosts include Hemiptera, and apart from the relatively small number of ichneumonids attacking spiders and pseudoscorpions, these are the only ichneumonids associated, albeit indirectly, with hosts other than immature stages of holometabolous insects. The primary parasites attacked by mesochorines are almost always endophagous, but they have been reared from ectoparasites, such as *Phytodietus* (Tryphoninae).

The female mesochorine inserts her fine ovipositor into the haemocoel of the primary host and uses it to locate primary parasite larvae, into which she oviposits. The mesochorine larva develops internally. Many mesochorines attack gregarious endoparasites and often several individual larvae within a host will be parasitized. Mesochorines are koinobionts and the adults emerge from the cocoons or puparia of their primary parasite hosts.

METOPIINAE

The Metopiinae is an average-sized subfamily comprising about 600 valid, described species world-wide; with the two largest genera, *Exochus* and *Metopius*, accounting for about half of these. Sixty-two species, representing nine genera are recorded from Britain. Small metopiines are sometimes confused with orthocentrines but the two groups can be separated easily on the shape of the antennal scape, which is elongate and subcylindrical in orthocentrines and of the normal ichneumonid type in metopiines.

What little is known of general metopiine biology can be summarized as follows: hosts are Lepidoptera; larval metopiines are koinobiont, solitary and endophagous; oviposition is into the host larva; and adult emergence is from the host pupa, within which a flimsy cocoon is spun. The adult escapes by cutting off the anterior end of the host pupa. Host species are those with larvae which are exposed or lightly concealed (for example, in leaf rolls) and oviposition is often into an early instar. Although there are reasonable numbers of published host records for Metopiinae the dubious value of many means that it is virtually impossible to use them as a basis for generalisations about host associations of individual genera; an all too common situation in the Ichneumonidae. Colour patterns and behaviour suggest that adults of many larger species (for example, *Metopius*) are involved in mimicry complexes as Batesian mimics. When disturbed, adults of some smaller species (*Exochus*) are able to produce a pungent odour, which presumably has a defensive function.

A lot of information on metopiine biology has come from work on the parasites of *Zeiraphera diniana* (Gueneé) (Tortricidae) in the Alps. The most important observations relate to *Chorinaeus funebris* (Gravenhorst), *Triclistus podagricus*

(Gravenhorst) and *Triclistus pygmaeus* (Cresson) and give us some insight into how a group of relatively closely related parasites partition a single host species resource. All three species are univoltine. *C. funebris* and *T. podagricus* are arrhenotokous, males forming 32-57 per cent of samples, whilst *T. pygmaeus* is presumably thelytokous, males being extremely rare (about one per cent of samples). *T. podagricus* tends to occur at lower altitudes than *T. pygmaeus* and *T. podagricus* females mainly attack third instar larvae whilst *T. pygmaeus* prefers those in the fifth instar.

In *Triclistus* the ovipositor is inserted behind the head of the host larva and the egg is deposited in, or adjacent to, the suboesophageal ganglion. In *T. podagricus* the egg does not hatch until about the time of host pupation. Larval growth takes 20 to 25 days but pupation does not take place until the larva has experienced a period of lower temperature. The adult emerges in the autumn but remains within the host pupa until the following spring. In contrast *T. pygmaeus* overwinters as a fully-grown larva within its cocoon inside the host pupa and pupates in the following spring.

Females of *C. funebris* insert their ovipositor into the host's anus and very quickly deposit an egg in the hind gut. The egg hatches within the gut after about 4 days and the first instar larva makes its way through the gut wall into the haemocoel. The hosts selected by this species are in the last larval instar and if the parasite has not reached the haemocoel before host pupation it perishes (possibly as a result of simple mechanical expulsion at ecdysis). Females of all three species feed on host body fluids after oviposition, in *Triclistus* at the site of ovipositor insertion and in *Chorinaeus* at a wound especially made with the mandibles. Caterpillars parasitized by *C. funebris* continue to feed normally before pupation. The first instar parasite larva is of the caudate type. Larval development takes 20 to 22 days and the fully-grown *C. funebris* larva spins a fine white cocoon within the host pupa in which it overwinters; pupating in the following spring. The first adults were found in June. Males survived for about one month in conditions similar to those in nature, while females survived for between two and three months and in that time individual females laid a maximum of 80 eggs.

ARMAGH: Poyntzpass, 15 June 1914, hill, 24 June 1916, field, 26 August 1921, road, WFJ (NMI); DOWN: Drinnahilly, 11 July 1965, AWS (NMI).

***Triclistus squalidus* (Holmgren, 1858)**

ARMAGH: Poyntzpass, {3 and 17} August {1915 and 1921}, field, at hogweed *Heracleum*, an uncommon species, WFJ (NMI) (Johnson, 1916a: p. 20 as *Exochus*; Johnson, 1922b: p. 69 as *Exochus*).

****Trieceles tricarinatus* (Holmgren, 1858)**

New to Ireland

KILDARE: Skerries Bog, 19 September and 3 October 1946, AWS (NMI).

MICROLEPTINAE

This small subfamily is Holarctic in distribution and comprises only *Microleptes*. Very few details of the biology are known. An unidentified North American species was reared from the stratiomyid *Allognosta fuscitarsis* (Say) (Diptera). No cocoon was spun, pupation being within the larval skin of the host. The European species *M. obenbergeri* is a parasite of *Chloromyia formosa* (Stratiomyidae).

***Microleptes aquisgranensis* (Förster, 1871)**

These include five specimens given me by friends, namely R. C. Faris, the late J. N. Halbert, the late E. O'Mahony and the late R. A. Phillips. The dates of capture range from July 28th to September 30th (mainly August and September)).

NEORHACODINAE

The Neorhacodinae includes only three very small genera. Three species occur in the Palaearctic region, others being found in North and South America.

Specimens may not at first be recognized as ichneumonids because of their small size, absence of pigment from many wing veins and small number of antennal segments (13 to 15). An important character in the fore wing is the obliteration of the rs-m cross veins caused by fusion of veins RS and M.

Little biology is known other than the hosts are *Spilomena* species (Hymenoptera: Sphecidae) in southern Britain. Host species identified with certainty were *S. enslini* Blüthgen and *S. troglodytes* (Vander Linden). *Neorhacodes* appears to attack the host larva; an elongate-ovoid, fairly thick cocoon is made, and adult emergence takes place about the same as that of the hosts.

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

***Neorhacodes enslini* (Ruschka, 1922)**

DUBLIN: Skerries, Dublin Road, reared 28 May – 12 June 2003 from cocoons of *Spilomena troglodytes* (Vander Linden) (Hymenoptera: Crabronidae) found in the borings of *Anobium* sp. (Coleoptera) in dead wood attached to a shed wall, COR (Ronayne and O'Connor, 2006: p. 48); TYRONE: Moy, 2♀♀ 22-28 July 1985, malaise trap in a rural garden, MRB (NMI and UM) (Boston, 1986b: p. 116).

Ireland (Notton and Shaw, 1998: p. 214)

OPHIONINAE

The Ophioninae is, world-wide, a large subfamily with 32 genera. In the British Isles there are 23 species representing 4 genera. The adults are often attracted to lights. Consequently the species are relatively easy to sample and the group is well represented in collections. Taxonomically it is one of the best known subfamilies. It is divided into five groups of genera. The *Ophion*-group is the most primitive and is dominant and most diverse in the north temperate zone. There are more species in tropical than temperate zones; with the greatest diversity of species in tropical montane forest between 1200 and 1700 m, although they occur in all habitats from high montane heathland to semidesert.

With few, but notable, exceptions adult ophionines are nocturnal or crepuscular and are pale in colour, have long slender bodies and appendages, enlarged ocelli and large wings. These adaptations are found in several other, unrelated groups of nocturnal ichneumonoids and have been termed the 'ophionoid facies'. Apart from the 'ophionoid facies', which are shared with some members of unrelated subfamilies, the main recognition feature of the Ophioninae is the spurious vein in the fore wing. A small number of ophionine genera comprise species which have lost, presumably secondarily, some of the ophionoid facies and are day flying. Some of the nocturnal species may also be found flying during the day, particularly in dull weather and particularly males.

Females search for nocturnally active caterpillars of various families of Lepidoptera

feeding in exposed positions. Species of *Ophion*, for example, mainly attack Noctuidae. Many ophionine species attack caterpillars in their middle instars but some oviposit into very early larvae, the latter group having about twice as many (24) ovarioles per ovary as the former (6 to 15). In most ophionines the fully-grown larva emerges from the host last instar larva and makes a cocoon in the soil or litter layer, but others wait until the host has spun its cocoon, within which the parasite then spins its own. *Ophion parvulus* Kriechbaumer is exceptional in forming its cocoon within the ruptured pupal remains of the host. Ophionine cocoons are elongate-ovoid, have a felt-like external surface and are generally dark brown in colour with a slightly paler equatorial band.

In Europe most species of the subfamily are univoltine. Some may have more than one generation, but apparent bivoltinism may be an artefact of our inability to discriminate good biological species. There is circumstantial evidence that some species overwinter as fully-grown larvae within their cocoons, while others, possibly only those with a flight period very early in the year, are thought to pass the winter as adults within their cocoons.

ORTHOCENTRINAE

This moderate-sized subfamily comprises small ichneumonids which are often only

weakly sclerotized (and consequently many dry, pinned specimens in collections have a distorted, shrivelled appearance). Two of the genera, *Orthocentrus* and *Stenomacrus*, have large numbers of species and the subfamily is world-wide in distribution, with about 450 described species in total. Although little serious work has been done on the British Isles fauna there are records of about 100 species. Part of the subfamily (that sometimes recognised as the Helictinae) was part of a 'wastebasket' group known then as Microleptinae or Oxytorinae. Some of the *Orthocentrus*-group might be confused with small metopiines but can be recognized easily by their characteristic elongate, subcylindrical antennal scape.

Little is known about the biology of orthocentrines, although most workers, on the basis of the few published records, confidently describe them as parasites of fungus gnats (Diptera). Adult orthocentrines are most often collected in cool, damp habitats. Females of some arctic and subarctic species of *Stenomacrus* are brachypterous. The species *Neurateles papyraceus* Ratzeburg has a long telescopic metasoma which bears very conspicuous erect bristles. It has been reared from larvae of *Xylosciara lignicola* (Winnertz) (Sciaridae) found under bark of pine and spruce. It has been suggested that some species are apparently highly specialised, for example, *Proclitus edwardsi* Roman may attack only *Brachypeza radiata* Jenkinson, a mycetophilid developing only in the fungus *Pleurotus cornucopiae* which is itself confined to *Ulmus*. Despite these and other rearings from reliably identified hosts the published data do not even indicate whether orthocentrines develop as ecto- or endoparasites. They are almost certainly koinobiont endoparasitoids because, in *Orthocentrus* at least, adult emergence is from the host pupa, showing that the larva is endophagous. Cocoons of the 'helictine' group are described as tightly woven; thin or semi translucent or robust; and brown in colour. The last larval instar of at least one species has well-developed caudal bristles.

ORTHOPELMATINAE

This subfamily comprises a single, Holarctic genus, *Orthopelma*. Eight species are known, of which two occur in the British Isles.

Orthopelma species are koinobiont endoparasites of gall-forming Cynipidae (Hymenoptera) - *Diplolepis* on *Rosa* and *Diastrophus* on *Rubus*. The common European species, *O. mediator* (Thunberg), is univoltine and adults emerge from galls of its regular host, *Diplolepis rosae* (Linnaeus) on *Rosa*, at about the same time as the host itself, from about mid May to mid July in Britain. The host larval stage is attacked and the parasite is solitary and endophagous. There is no external sign of the parasite until about the end of September, when it has consumed the entire body contents of its host, to which it imparts its own shape. The host skin is cast off after a few days and in a few weeks, about the end of October, the fully-grown *Orthopelma* larva begins to assume a prepupal form. These developments are more pronounced about April, before pupation takes place. Apparently no cocoon is spun. Within the gall *O. mediator* itself may be subject to attack by the chalcid *Pteromalus bedeguaris* (Thomson) (Hymenoptera, Pteromalidae), which develops externally on the prepupa or pupa.

***Orthopelma mediator* (Thunberg, 1824)**

synonym *Orthopelma luteolator* (Gravenhorst, 1829)

ARMAGH: Poyntzpass, bred from *Rhodites rosae* L. (now *Diplolepis rosae* (L.)) (Hymenoptera: Cynipidae), WFJ (NMI) (Johnson, 1921a: p. 105 as *Orthopelma luteolator*); same locality, emerged April, May, reared from bedeguar of *Rhodites rosae* collected September 1920 in a hedge by the roadside, WFJ (NMI) (Johnson, 1922b: pp 67, 69 as *Orthopelma luteolator*).

PHRUDINAE

This is a small subfamily comprising eleven genera. Six species, representing two of the five European genera, have been found in the British Isles. Very little is known of their host associations or biology, they are rather diverse in structure and to some extent the grouping is one of convenience. Care needs to be taken not to overlook the smaller phrudines when sorting samples; they can easily be confused with small cryptines.

From the very little that is known it has been concluded that Phrudinae parasitize beetle larvae. The European species *Earobia paradoxa* (Perkins) is a koinobiont endoparasitoid of a derodontid. In North America species of *Peucobius* have been collected in large numbers from immature staminate cones of *Pinus* species.

In central Europe *E. paradoxa* and its host, *Laricobius erichsonii* Rosenhauer, are univoltine. Only females of *E. paradoxa* are known so it can be assumed that the species is thelytokously parthenogenetic. From mid May to mid June females search on the bark of conifers for third and fourth instar larvae of *L. erichsonii*, which feeds on adelgids. The host is usually stabbed with the ovipositor on the lateral or ventral part of the posterior third of the abdomen. The ovipositor remains inserted for about 20 seconds and the host becomes temporarily paralyzed. The egg is deposited in the host's fat body and by the time it is ready to hatch has increased considerably in volume (about 20 times). The females frequently host-feed at the site of ovipositor insertion and they also feed on adelgid honeydew. The ichneumonid larva remained small whilst the host continued to be active. When the beetle larva descended to the

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

forest floor litter in midsummer (where it would normally pupate and an adult beetle would emerge three or four weeks later) the parasite grew rapidly, finally devouring the entire host except for its cuticle. The phrudine larva then broke out of the host skin and spun a whitish cocoon studded externally with soil particles. The adult emerges in the following spring.

PIMPLINAE

The Pimplinae is moderately large and is well represented in both temperate and tropical zones. Many species are important in controlling populations of pest insects, and as a result the subfamily is relatively well studied. The Pimplinae was one the traditional, five subfamilies into which the family was divided. However,

improvements in ichneumonid taxonomy over the last 50 years have resulted in the separation of obviously unrelated elements and the better definition of tribes and genera. The latest work recognises the rhyssines, poemeniines and diacritines as distinct subfamilies. Probably this subfamily, even as now restricted, is biologically more diverse than any other, attacking a very wide range of hosts and including ecto- and endoparasitic species.

With the exception of *Clistopyga*, *Tromatobia*, *Zaglyptus* and the *Polysphincta*-group, which are associated with spiders and their egg cocoons, the genera of the tribe Ephialtini develop as ectoparasites of holometabolous insect larvae, prepupae or pupae that are more or less fully concealed: in wood or stems, under bark, in spun vegetation, or in cocoons. The host is stung and permanently paralyzed or possibly killed prior to oviposition and the egg is laid on or adjacent to it. The conditions that the developing pimpline larva experiences are physiologically relatively undemanding and have little to do with limiting host range. Thus many pimplines have host ranges which are taxonomically very broad and are, instead, restricted in terms of an 'ecological niche'. Examples of niche-specialization with great disparity in the actual hosts utilized are found in many species of *Scambus*.

The evolution of the the *Polysphincta*-group (then recognized as a discrete tribe the Polysphinctini), parasitizing mobile immature spiders, can be traced from ancestral habits of attacking spider egg cocoons, and in particular those that are in well defined nests guarded by the parent spider. Habits transitional to those of the *Polysphincta*-group are said to be present in extant ephialtine genera such as *Clistopyga* and *Zaglyptus*. These include attack on the guarding spider, sometimes before it has laid its eggs, and development on both adult and eggs, as well as consumption of spiderlings within the egg cocoon rather than the eggs themselves. These suppositions are based on somewhat limited observations, however.

Schizopyga seems sometimes to oviposit onto adult spiders but as far as is known other polysphinctine genera normally attack immatures, and most overwinter as small larvae on active spiders. Members of the *Polysphincta*-group are remarkable in being

the only Pimplinae known to allow the host some further development after being attacked, and also for the extreme specialisation of their larvae. In addition to ventral protuberances by means of which the larvae fix themselves to a caked saddle of their progressively accumulated exuviae on the integument of the host spider, in their final instars polysphinctine larvae develop more-or-less paired wart-like dorsal protuberances on several consecutive central body segments, each retractile and furnished with outwards-projecting hooks. These structures differ according to genus, and are used by the larva to grip the silk spun by the host as the parasitoid larva releases its hold on the host itself to finish its feeding, and then to move rather easily among strands of the host's silk as it constructs its cocoon. Final instar larvae of the ephialtine genera *Zaglyptus* and *Clistopyga* are furnished with broadly similar hook-bearing warts, although *Tromatobia*, which similarly feeds in spider egg cocoons but is arguably more primitive, has less elaborate structures bearing only unhooked spines. Fields of cuticular hooks forming holdfasts also occur in larvae of the genus *Sericopimpla*, which attack Psychidae (Lepidoptera). In all cases these structures seem to aid movement and orientation via the hosts silk during cocoon formation, albeit in slightly different ways. The cocoons of polysphinctines are highly specialised and those constructed exposed in the spider's web are dense and spindle shaped. Most have a clearly visible caudal opening through which the meconium is voided.

Larvae of species of the tribe Pimplini are endophagous. The egg is most often deposited inside a lepidopterous pupa and the host is normally inactivated soon after attack. In the case of *Pimpla*, at least, this is accomplished by the newly hatched larva, which quickly migrates to the host's brain; although selective egg placement and injected secretions from the female's accessory glands also play a part in overcoming the host's defences. Facultative hyperparasitism within lepidopterous pupae is fairly common in the Pimplini and some species of *Itoplectis* attack fully exposed ichneumonid and braconid cocoons as well (acting as pseudohyperparasites). Whether or not the larvae of these species feed endophagously in these circumstances does not seem to have been investigated.

Ephialtini (including Polysphinctini)

***Acrodactyla degener* (Haliday, 1839)**

CORK: Fota, ♀ 5 September 1986, KGMB (UM) (det. MRB); TYRONE: Moy, ♀♀ 14 August 1983, 4 and 29 August 1984 and 24 September 1984 (UM) (det. MRB) (all unpublished).

Ireland (Haliday, 1839: p. 117 as *Pimpla*. In the same situations with the last (i.e. in shady groves) (♂ NMI); Morley, 1908a: p. 133; Fitton, Shaw and Gauld, 1988: p. 66 widely distributed throughout).

***Acrodactyla madida* (Haliday, 1839)**

Ireland (Broad, 2006).

***Acrodactyla quadrisculpta* (Gravenhorst, 1820)**

Avoca (Ovoca), ♀, AHH (NMI) (det. MRS) (O'Connor, 2004b: p. 431).

Ireland (Townes *et al.*, 1965: p. 35; Fitton, Shaw and Gauld, 1988: p. 68 uncommon; widely distributed; Shaw, 2006: p. 230 its occurrence in Ireland now requires confirmation).

****Acropimpla didyma* (Gravenhorst, 1829)**

New to Ireland

DOWN: Murlough NNR, ♂ 19-22 October 1984, BHN (UM) (det. MRB and RN).

***Afrephialtes cicatricosus* (Ratzeburg, 1848)**

CORK (West): Glengarriff, ♂ emerged 23 June 1953, ex larva of a welsh clearwing *Synanthedon formicaeformis* (Esper) (Lepidoptera: Sesiidae) in willow *Salix* twigs, collected April 1953, ESAB (NMI); Glengarriff district, ♀ emerged 9 June 1954, ex *S. formicaeformis*, ESAB (NMI) (both O'Connor and Shaw, 2004: p. 119).

Ireland (Shaw, 2006: p. 220).

***Clistopyga incitator* (Fabricius, 1793)**

ARMAGH: Poyntzpass, ♀ 12 July 1910, WFJ (Johnson, 1912a: p. 78); same locality, June 1916, in garden, WFJ (Johnson, 1917a: p. 39); Poyntzpass hill, July, WFJ (Johnson, 1920a: p. 9); DONEGAL: Portnoo, June, on roadsides, WFJ (Johnson, 1919a: p. 36); Portnoo shore and mountain road, ♂ June, WFJ (NMI) (conf. MRS) (Johnson, 1920a: p. 9 there was quite a number); DOWN: Rostrevor, 26 June 1929, grass plot, 7 and 8 August 1929, field opposite, 7 September 1929, in house, WFJ (NMI) (conf. MRS) (Johnson, 1930: p. 157); DUBLIN: Mayfield, Harold's Cross, ♂ 10 June 1929, AWS (NMI) (det. AWS, conf. MRS); Lambay, ♀ June 1906 (NMI) (det. MRS); KERRY: Flesk, Killarney, ♀ August 1935, EFB (NMI) (det. AWS, conf. MRS) (all unpublished); LOUTH: Termonfeckin, ♀ August 1924, WFJ (Johnson, 1927: p. 159); MAYO: Clare Island, 2♀♀ June 1911, WFJ (NMI) (conf. MRS); near Westport, ♀ June 1909, JNH (NMI) (conf. MRS) (Morley, 1911a: p. 12); TYRONE: Moy, ♂♂♀♀ 24-30 June 1985, hawthorn *Crataegus*, herbaceous verge and 23 July 1985 (♂♂), 17-28 June 1985, 1-7 July 1985 (♀♀), all Malaise trap, MRB and RN (UM) (det. MRB and RN); WICKLOW: Greystones, ♀ 29 August 1927, AWS (NMI) (det. AWS, conf. MRS) (all unpublished).

Ireland (Fitton, Shaw and Gauld, 1988: p. 60 common and widely distributed throughout).

***Dolichomitus agnoscendus* (Roman, 1939)**

DOWN: no locality {Tollymore Park, ♀ 25 June 1961, AWS (NMI)}; KERRY: no locality (both Fitton, Shaw and Gauld, 1988: p. 38); WICKLOW: Clara, ♀ 22 May 1954, AWS (NMI) (unpublished).

Ireland (Alexander, 2000: p. 75).

****Dolichomitus imperator* (Kriechbaumer, 1854)**

New to Ireland

DOWN: Rostrevor, ♂ 14 June 1974, oak *Quercus* woodland, RN (UM) (det. JPB).

***Dolichomitus pterelas* (Say, 1829)**

KERRY: no locality {♀ 19 July 1932, Donovan sisters (NMI)} (Fitton, Shaw and Gauld, 1988: p. 40; Alexander, 2000: p. 75).

***Dolichomitus tuberculatus* (Geoffroy, 1785)**

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

ARMAGH: Poyntzpass, WFJ (Johnson, 1907: p. 246 as *Cryptus*); CORK: Glengariff, ♀ 13 July 1924, JNH (NMI) (det. AWS and MRS); Ummera, ♀ 1934, Donovan sisters (NMI) (det. AWS and MRS); DONEGAL: no locality, ♀ 14 July 1899 (NMI) (det. MRS) (all unpublished); DOWN: Newcastle, ♀♀ 25 May 1927, 9 and 11 June 1927 (NMI) (Johnson, 1927: p. 159 as *Ephialtes*. ♀; Johnson, 1929: p. 136 as *Ephialtes*); Rostrevor, June 1924 and September 1925, in woods, WFJ (NMI) (Johnson, 1927: p. 159 as *Ephialtes*. ♀); same locality, ♂♂ 20, 27 and 29 May 1929, woods, WFJ (NMI) (Johnson, 1930: p. 157 as *Ephialtes*); KERRY: Blackstones, ♀ 4 July 1934, AWS (NMI) (unpublished); WATERFORD: Stradbally, ♀ 22-30 June 1907, HWA (Morley, 1908b: p. 276 as *Ephialtes*); WICKLOW: Devil's Glen, ♂ 23 June 1929, AWS (NMI) (unpublished).

Ireland (Fitton, Shaw and Gauld, 1988: p. 40 uncommon but widely distributed; Alexander, 2000: p. 75).

***Dreisbachia pictifrons* (Thomson, 1877)**

ARMAGH: Peatlands, ♀ 13 August 1985, cut over bog, MRB (UM) (det. MRB and RN); CORK: Fota, ♀ 13 September 1986, KGB (UM); DOWN: Tollymore, ♀ 21 August 1984, MRB (UM) (det. MRB) (all unpublished); WICKLOW: Glen of the Downs, ♀ 12 August 1937, BPB (NMI) (det. MRS) (Fitton, Shaw and Gauld, 1988: p. 62; O'Connor, 2004b: p. 432).

Ireland (no locality, ♀, AHH (NMI) (det. MRS) (O'Connor, 2004b: p. 432)).

***Endromopoda arundinator* (Fabricius, 1804)**

synonym *Endromopoda melanopyga* (Gravenhorst, 1829)

CARLOW: Oak Park, ♀ 3 July 1940, AWS (NMI) (det. AWS as *Endromopoda melanopyga*); KILDARE: Newbridge Fen, ♀ 11 July 1982, JMOC (NMI) (det. MRS); WESTMEATH: Ballnafid Lake, ♂ 22 June 1989, JPOC (NMI) (det. MRS) (all unpublished); WICKLOW: no locality {Holdenstown Bog}, ♀ 9 August 1953, AWS (NMI) (det. AWS); Killoughter, ♀ 11 June 1953, AWS (NMI) (det. AWS as *Endromopoda melanopyga*) (Fitton, Shaw and Gauld, 1988: p. 46).

Ireland (Aubert, 1969: p. 26 as *Scambus*).

***Endromopoda detrita* (Holmgren, 1860)**

synonym *Endromopoda brunnea* (Brischke, 1880)

ANTRIM: Rea's Wood, ♀ 25 September 1984, MRB and RN (UM) (det. MRB and RN) (unpublished); ARMAGH: Poyntzpass, October, on the wing, WFJ (NMI) (Johnson, 1913: p. 140 as *Pimpla*); DONEGAL: Coolmore, September, at flowers of Umbelliferae, WFJ (Johnson, 1916a: p. 20 as *Pimpla*); Glebe House, ♀ 25 September 1989, MRB (UM); DOWN: Rostrevor, ♀ 17 May 1929, woods, WFJ (NMI) (det. MRS); DUBLIN: Bull Island, ♂♀ 9 May 1982, swept in the alder *Alnus glutinosa* marsh, JMOC (NMI) (det. MRS); Slade of Saggart, ♀ 18 July 1982, JMOC (NMI) (det. MRS); GALWAY: Kylemore, ♀ 25 July 1982, swept amongst mixed trees beside the river, JMOC (NMI) (det. MRS); KERRY: Killarney, ♀ August 1923, EFB (NMI) (det. MRS); Muckross, ♀ 2 August 1937, BPB (NMI) (det. MRS); Rossbeigh, HD (Morley, 1908a: p. 89 as *Pimpla*); Tomies Wood, ♀ 15 September 1981, JPOC (NMI) (det. MRS); WESTMEATH: N'thlow (Newtownlow), ♀ 12 May 1929, AWS (NMI) (det. AWS as *Pimpla brunnea*); ROSCOMMON: Castlerea, ♀ 28 July 1982, swept in mixed wood, JMOC (NMI) (det. MRS); WEXFORD: near Coolgreany, ♀♀ 22 July 1927, AWS (NMI) (det. AWS and MRS); WICKLOW: Arklow district, ♂ 2 August 1925, AWS (NMI) (det. AWS); Kilmacanogue, ♀ 15 August 1982, JMOC (NMI) (det. MRS); Rathdrum, ♀ 12 August 1926, AWS (NMI) (det. AWS) (all unpublished).

Ireland (Fitton, Shaw and Gauld, 1988: p. 46 generally common and widespread infertile grassy habitats throughout the British Isles.)

***Endromopoda nigracoxis* (Ulbricht, 1910)**

ANTRIM: Rea's Wood, 2♀♀ 22 May 1985 and 30 May-2 June 1985, MRB and RN (UM) (det. MRB and RN); TYRONE: Moy, 2 ♀♀ 2 June 1985, hawthorn *Crataegus*, herbaceous verge, MRB (UM) (det. MRB and RN) (both unpublished).

Ireland (Fitton, Shaw and Gauld, 1988: p. 47 uncommon, but widely distributed in grassland habitats throughout the British Isles).

Ireland (Broad, 2006.)

***Ephialtes ?inanis* (Schrank, 1802)**

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

WEXFORD: Enniscorthy, AB (Morley, 1908a: p. 86 as *Pimpla inanis*.)]

***Ephialtes manifestator* (Linnaeus, 1758)**

synonym *Ephialtes carbonarius* (Christ, 1791) preoccupied

ARMAGH: Poyntzpass, June, on window, WFJ (Johnson, 1922b: p. 69 as *Ephialtes carbonarius*); CLARE: Corofin, ♀ 24 April 1973, road through deciduous woodland /verge, RN (UM) (det. MRB) (unpublished); KERRY: no locality (Fitton, Shaw and Gauld, 1988: p. 35; Alexander, 2000: p. 75).

***Exeristes ruficollis* (Gravenhorst, 1829)**

WEXFORD: Courtown (Courten), early September 1893, AB (Morley, 1908a: p. 59).

***Gregopimpla inquisitor* (Scopoli, 1763)**

CARLOW: Carriglead, ♂♀ 15 May 1935, beaten off beech *Fagus* tree in cop., AWS (NMI) (det. AWS) (unpublished); MAYO: Clare Island, ♀ June 1911, WFJ (Morley, 1911a: p. 12 as *Pimpla*).

***Iseropus stercorator* (Fabricius, 1793)**

CAVAN: Virginia, ♂ 20 May 1982, alder *Alnus* fen, JMOC (NMI) (det. MRS) (O'Connor, 2004b: p. 432).

Ireland (Fitton, Shaw and Gauld, 1988: p. 56).

***Liotryphon ascaniae* (Rudow, 1883)**

synonym *Liotryphon ruficollis* (Desvignes, 1856)

ARMAGH: Poyntzpass, May, field, WFJ (Johnson, 1919a: p. 36 as *Pimpla ruficollis*).

***Liotryphon crassiseta* (Thomson, 1877)**

ARMAGH: Poyntzpass, ♀ June 1921, WFJ (NMI) (det. MRS) (unpublished); CORK: no locality {Monkstown, ♀ (NMI)}; KERRY: no locality (Fitton, Shaw and Gauld, 1988: p. 42); KILDARE: Emo, ♂ 15 May 1949, AWS (NMI) (det. JFP) (unpublished).

***Megaetaira madida* (Haliday, 1839)**

MAYO: Achill Sound, ♂ June 1910, WFJ (NMI) (det. JFP and conf. MRS) (O'Connor, 2004b: p. 431 as *Acrodactyla*).

Ireland (Haliday, 1839: p. 117 as *Pimpla*. In shady groves (♂♂♀♀, NMI); Morley, 1908a: p. 132; Fitton, Shaw and Gauld, 1988: p. 67 uncommon but widely

distributed).

***Polysphincta rufipes* Gravenhorst, 1829**

Ireland (Fitton, Shaw and Gauld, 1988: p. 65).

***Polysphincta tuberosa tuberosa* Gravenhorst, 1829**

TYRONE: Moy, ♀ 22-28 October 1984 and 29 August 1983, hawthorn *Crataegus*, herbaceous verge, MRB (UM) (det. MRB) (unpublished).

Ireland (Jussila, 1965: p. 25).

***Polysphincta vexator* Fitton, Shaw and Gauld, 1988**

WICKLOW: Kilmacanoge, ♀ 15 August 1982, swept in a small wooded marsh along a stream, JMOC (NMI) (det. MGF) (O'Connor and Butler, 1992: p. 164).

Ireland (Shaw, 2006: p. 227).

***Scambus annulatus* (Kiss, 1924)**

CARLOW: Thomastown, ♀, (NMI) (det. MRS); DUBLIN: Portmarnock, ♀ 23 September 1928, JNH (NMI) (det. IDG); Seapoint, ♀ emerged 16 December 1939, bred from *Gracilaria syringella* (now *Caloptilia syringella* (Fabricius)) (Lepidoptera: Gracillariidae) on privet *Ligustrum*, BPB (NMI) (det. MRS); WICKLOW: Lough Dan, 28 September 1909 (NMI) (det. MRS) (O'Connor, 2004b: p. 433).

Ireland (Fitton, Shaw and Gauld, 1988: p. 50 common, widely distributed in the British Isles.)]

***Scambus brevicornis* (Gravenhorst, 1829)**

synonym *Pimpla punctiventris* Thomson, 1877

synonym *Pimpla nigriscaposa* Thomson, 1877

synonym *Scambus anomalus* (Morley, 1906)

ANTRIM: Killead, August 1923, WFJ (Johnson, 1927: p. 159 as *Pimpla*. ♂♀); Rea's Wood, ♀ 30 May 1973, AGI (UM) (det. MRB and RN) (unpublished); ARMAGH: Poyntzpass, ♀ 30 July 1909, ♂ 30 August 1909, WFJ (Morley, 1911b: p. 126 as *Phthorimus anomalus*; Johnson, 1912a: p. 78 as *Pimpla*; Johnson, 1912a: p. 79 as *Phthorimus anomalus*); CAVAN: Long Hill, Cleggy, ♀ 29 July 1933, RCF (NMI); CLARE: Lough Atorick, ♀ June 1921, JNH (NMI) (both unpublished); DONEGAL:

Coolmore, ♀♀ September, among sallows *Salix*, WFJ (NMI) (Johnson, 1913: p. 140 as *Pimpla*; Johnson, 1917a: p. 39 as *Pimpla*); same locality, September, on roadside, among herbage, WFJ (Johnson, 1915: p. 132 as *Pimpla punctiventris*; Johnson, 1917a: p. 39 as *Pimpla punctiventris*); same locality, September, at wild carrot *Daucus carota*, not common, WFJ (Johnson, 1916a: p. 20 as *Pimpla punctiventris*); Portnoo, ♀♀ September 1917, among herbage, WFJ (NMI) (Johnson, 1918: p. 108 as *Pimpla*; Johnson, 1919a: p. 36 as *Pimpla punctiventris*); DOWN: Dromore, August 1925, WFJ (Johnson, 1927: p. 159 as *Pimpla*. ♂♀); Greencastle, ♂♀ 24 August 1930, roadside, WFJ (Johnson, 1931c: p. 140 as *Pimpla brevicornis* var. *nigriscaposa* Thomson); Newcastle, ♀ August 1926, var. *nigriscaposa*, WFJ (NMI) (Johnson, 1927: p. 159 as *Pimpla*. ♂♀); same locality, ♀ 16 September, WFJ (NMI) (Johnson, 1929: p. 136 as *Pimpla nigriscaposa*); same locality, ♂♀ 9, 11 and 29 September (NMI), WFJ (Johnson, 1929: p. 136); Rostrevor, ♀♀ September 1923 (NMI), also var. *nigriscaposa*, WFJ (Johnson, 1927: p. 159 as *Pimpla*. ♂♀); Rostrevor, Victoria Square, ♀ 6 September 1929, WFJ (Johnson, 1930: p. 157 as *Pimpla nigriscaposa*); Rostrevor, ♀ 19 July 1975, oak *Quercus* woodland, RN (UM) (unpublished); DUBLIN: Howth, ♀ 18 April 1924, EOM (NMI); North Bull, ♀♀ 18 September 1926, EOM (NMI); North Bull Island, 1960-1963, salt marsh, BH (det. AWS) (Speight and Healy, 1977: p. 153 as *Ephialtes*); Rogerstown, ♀ 19 August 1923, AWS (NMI); Rush, ♀ 19 August 1923, AWS (NMI) (both unpublished); GALWAY: Clonbur, ♀, RFS(NMI); LAOIS: The Derries, ♀ 20 September 1982, mixed wood, JPOC (NMI); LONGFORD: Sixtowns, ♀ July 1930, GB (NMI) (all unpublished); LOUTH: Termonfeckin, ♀ August 1924, also var *nigriscaposa*, WFJ (NMI) (Johnson, 1927: p. 159 as *Pimpla*. ♂♀); MAYO: Castlebar, ♀ July 1911, JNH (NMI) (unpublished); Clare Island, ♀♀, 1910 (NMI) and 1911 (NMI), WFJ; Knappagh near Westport, PEG; Polranny, WFJ (NMI) (Morley, 1911a: p. 12 as *Pimpla*); TYRONE: Moy, ♂♀ 2 June 1985 and ♂ 23 July 1983, hawthorn *Crataegus*, herbaceous verge, MRB (UM) (det. MRB); WATERFORD: Cappoquin, ♀♀ 15 August 1928, AWS (NMI) (unpublished); WEXFORD: Kilmore, AB (Morley, 1908a: p. 75 as *Pimpla*);

WICKLOW: Clara, ♀ 22 May 1954, AWS (NMI); Maherabeg, ♀ 1 July 1927, AWS (NMI); Rathdrum, ♀ 4 August 1925, AWS (NMI) (all unpublished). (There is a very large series of this species in NMI and only a representative sample is indicated above).

Ireland (Fitton, Shaw and Gauld, 1988: p. 52 widely distributed and common throughout the British Isles).

***Scambus calobatus* (Gravenhorst, 1829)**

ARMAGH: Poyntzpass, 9 October 1909, WFJ (Johnson, 1912a: p. 78 as *Pimpla*); DONEGAL: Portnoo, September 1917, at flowers of wild carrot *Daucus carota*, WFJ (Johnson, 1918: p. 108 as *Pimpla*); DOWN: Dromore, ♂ August 1925, WFJ; DUBLIN: Howth, bred from some lepidopteron in thistle *Carduus* stems (Morley, 1908a: p. 84); LOUTH: Termonfeckin, ♀ August 1924, with abdomen strongly compressed, WFJ (both Johnson, 1927: p. 159 as *Pimpla*).

***Scambus elegans* (Woldstedt, 1876)**

DOWN: Rostrevor, ♂ September 1925, WFJ (Johnson, 1927: p. 159 as *Pimpla*).

***Scambus vesicarius* (Ratzeburg, 1844)**

DUBLIN: Ashtown, near the Royal Canal, reared from the galls of the sawfly *Pontania proxima* (Lepelletier) (Hymenoptera: Tenthredinidae) (AL-Saffar and Aldrich, 1997: pp 220-221); WICKLOW: Coan, ♀ 28 June 1931, AWS (NMI) (det. JFP); Deputy's Pass, ♂ 11 September 1932, AWS (NMI) (det. JFP) (both unpublished).

Ireland (Fitton, Shaw and Gauld, 1988: p. 55 uncommon; widely distributed in the British Isles; Yu, 1998: CD-Rom; Shaw, 2006).

***Schizopyga circulator* (Panzer, 1801)**

DONEGAL: Coolmore, among sallows *Salix*, WFJ (Johnson, 1915: p. 132).

Ireland (Fitton, Shaw and Gauld, 1988: p. 63 widely distributed).

***Schizopyga frigida* Cresson, 1870**

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

DOWN: no locality (Fitton, Shaw and Gauld, 1988: p. 63); MAYO: Clare Island, ♂ June 1911, WFJ (Morley, 1911a: p. 12 as *Schizopyga*); TIPPERARY: no locality (Fitton, Shaw and Gauld, 1988: p. 63).

***Schizopyga podagrica* Gravenhorst, 1829**

ARMAGH: Poyntzpass, June, August, on hill and in field, at hogweed *Heracleum*, WFJ (Johnson, 1915: p. 132 as *Exochus*; Johnson, 1917a: p. 39 as *Exochus*; Johnson, 1922b: p. 69 as *Exochus*); KERRY (South): Rossbeigh, June 1902, AD (Saunders *et al.*, 1903: p. 68; Morley, 1908a: p. 135).

***Schizopyga varipes* Holmgren, 1856**

LAOIS: Derry Hills, 2♂♂2♀♀ reared spring 1999 from trap-nests (*Rubus idaeus* stems) placed the previous summer in oak *Quercus* trees at the edge of a raised bog, COR (NMI and NMS) (Shaw, 2006: p. 226).

Ireland (Shaw, 2006: p. 226 a further male from trap nest in 1999/2000 but without unquestionable locality data).

***Sinarachna pallipes* (Holmgren, 1860)**

WICKLOW: Powerscourt Deerpark (Dpt), ♀ 10 September 1930, AWS (NMI) (det. AWS and conf. JPOC) (O'Connor, 2004c: p. 296).

****Townesia tenuiventris* (Holmgren, 1860)**

New to Ireland

WICKLOW: Ballyarthur, ♀ 25 August 1925, AWS (NMI) (det. AWS and conf. JPOC); Clara, ♂ 19 May 1929, AWS (NMI) (det. AWS, conf. AR and JPOC).

***Tromatobia lineatoria* (Villers, 1789)**

synonym *Tromatobia oculatoria* (Fabricius, 1798) misidentification

ANTRIM: Rea's Wood ♂♀ 25 September 1984, ♂ 4 June 1985, MRB (UM) (det. MRB and RN as *Tromatobia oculatoria*); ARMAGH: Poyntzpass, ♀ 24 April 1907, July, August (NMI), on gorse *Ulex*, fields, WFJ (Johnson, 1907: p. 246 as *Pimpla oculatoria*; Morley, 1907b: p. 160 as *Pimpla oculatoria*; Johnson, 1922b: p. 69 as *Pimpla oculatoria*); DUBLIN: Boher-na-breena, ♀ 7 July 1923, AWS (NMI) (det. MRS as *Tromatobia oculatoria*); Sutton, ♀ 3 July 1938, EOM (NMI) (det. MRS as *Tromatobia oculatoria*) (both unpublished); DOWN: Dunmurry, ♂ 15 September

1984, RN (UM); Murlough NNR, 3♀♀ 9-15 and 23-29 October 1984, all Malaise traps, BHN (UM) (det. MRB and RN as *Tromatobia oculatoria*); LOUTH: Carlingford, June 1921, WFJ (NMI) (Johnson, 1922a: p. 17 as *Pimpla oculatoria*); TYRONE: Moy, ♂♂♀♀ 11 and 25 September 1983, 20 November 1983, 25 May 1985, 23 October 1985, all Malaise traps, MRB and RN (UM) (det. MRB and RN as *Tromatobia oculatoria*); WICKLOW: Deputy's Pass, ♂ 18 August 1925 and ♀ 24 July 1929, AWS (NMI) (det. MRS as *Tromatobia oculatoria*); Powerscourt, ♂ 27 September 1929, AWS (NMI) (det. MRS as *Tromatobia oculatoria*); Rathdrum, ♂ 8 July 1926, ♀ 12 June 1927 and ♀♀ 13 July 1929, AWS (NMI) (det. MRS as *Tromatobia oculatoria*) (all unpublished).

Ireland (Fitton, Shaw and Gauld, 1988: p. 58 as *Tromatobia oculatoria*. Common throughout).

****Tromatobia ornata* (Gravenhorst, 1829)**

New to Ireland

DOWN: Murlough NNR, 2-9 October 1984, Malaise trap, BHN (UM) (det. MRB and RN).

***Tromatobia ovivora* (Boheman, 1821)**

ARMAGH: Poyntzpass, ♀ 12 June 1917, on wing at a plant of black bryony *Tamus communis*, WFJ (NMI) (conf. MRS) (Johnson, 1918: p. 108 as *Pimpla*); DOWN: Rostrevor, ♀ 21 October 1929, roadside on blade of grass, WFJ (Johnson, 1930: p. 157 as *Pimpla*); LAOIS: Emo, ♀ 27 June 1979, cut over valley bog invaded by willow *Salix* - birch *Betula* scrub, D. N. Dowling (NMI) (det. MGF) (unpublished); MAYO: Achill Sound, ♀ June 1911, WFJ (Morley, 1911a: p. 12 as *Pimpla*); WICKLOW: Clara, ♂ 27 May 1934, AWS (NMI) (det. JFP) (unpublished).

Ireland (Fitton, Shaw and Gauld, 1988: p. 58 uncommon but widespread).

***Tromatobia variabilis* (Holmgren, 1856)**

synonym *Tromatobia hibernica* (Morley, 1908)

CORK: Youghal, ♀3 August 1933, salt marsh, JNH (NMI) (det. MRS) (unpublished); KERRY: Kemmare, ♀ (type) 30 June 1901, JWY (BMNH) (Morley, 1908a: p.61 as *Pimpla hibernica*; Fitton, 1976: p.344 as *Pimpla hibernica*. Kenmore. Paralectotypes

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

4♂♂♀ and ♀; Fitton, Shaw and Gauld, 1988: p. 58); Kildare: no locality {Louisa Bridge, ♀ 22 August 1982, swept in marsh, JMOC (NMI) (det. MRS)} (Fitton, Shaw and Gauld, 1988: p. 58); WEXFORD: Kilmore, 4♂♂2♀♀ (types) 11 and 23 August 1898, AB (BMNH) (Morley, 1908a: p. 61 as *Pimpla hibernica*; Fitton, 1976: p. 344 as *Pimpla hibernica*. Lectotype ♀; Fitton, Shaw and Gauld, 1988: p. 58).

***Zaglyptus multicolor* (Gravenhorst, 1829)**

DUBLIN: Shankill, ♀ 5 September 1929, AAL (NMI) (det. AWS and conf. JPOC) (O'Connor, 2004b: p. 433).

***Zaglyptus varipes* (Gravenhorst, 1829)**

WATERFORD: Lismore, Dungarvan, ♂ 15 August 1928, AWS (NMI) (det. MRS) (O'Connor, 2004b: p. 434).

Ireland (Fitton, Shaw and Gauld, 1988: p. 59).

***Zatypota discolor* (Holmgren, 1860)**

WICKLOW: Glencree, ♂ 27 September 1931, AWS (NMI) (det. AWS and conf. JPOC) (O'Connor, 2004c: p. 296).

***Zatypota percontatoria* (Müller, 1776)**

MAYO: Achill, ♂ June 1911, WFJ (Morley, 1911a: p. 12 as *Polysphincta*); WICKLOW: Devil's Glen, ♀ 29 September 1954, AWS (NMI) (det. AWS and conf. JPOC) (unpublished).

Ireland (Morley, 1908a: p. 130 as *Polysphincta*. Haliday indicates no locality for this species, which he probably found in Ireland).

Pimplini

***Apechthis compunctor* (Linnaeus, 1758)**

synonym *Pimpla brassicariae* (Poda, 1761)

DOWN: Newcastle, ♂♀ 5 September, WFJ (Johnson, 1929: p. 136 as *Pimpla brassicariae*).

***Apechthis quadridentata* (Thomson, 1877)**

synonym *Apechthis resinator* Thunberg, 1822 misidentification

ANTRIM: Rea's Wood, ♂ 29 May 1984, MRB and RN; DOWN: Newcastle, ♀ 5

September 1927, WFJ (NMI) (det. MRS) (both unpublished); Rostrevor, ♂ 17 May 1929, woods, WFJ (NMI) (conf. MRS) (Johnson, 1930: p. 157 as *Pimpla resinator*); Murlough NNR, ♀♀ 9-15 and 23-29 October 1984, various other dates in October (all Malaise traps), BHN (UM) (det. MRB and RN); Seaforde, ♀ 1 October 1989, MRB (UM); Tollymore, ♀ 21 August 1984, MRB (UM); DUBLIN: Boher-na-Breena, ♂ 25 May 1927, AWS (NMI) (det. POEMENIINAE

The Poemeniinae is a small subfamily, represented in both temperate and tropical zones, but with only one species in the Afrotropical region and absent from the Australasia.

It seems likely that all members of the subfamily attack wood-inhabiting hosts. Some, such as *Poemenia*, have been reared from sphecid wasp nests made in old beetle burrows, but others are probably parasites of wood-boring beetles and the best-known genus, *Pseudorhyssa*, comprises cleptoparasites of rhyssine ichneumonids.

MRS) (NMI and NMS) (Shaw, 2006: p. 235).

RHYSSINAE

The Rhyssinae is a moderate sized subfamily, which was formerly part of the Pimplinae. Its 230-odd species include some of the ichneumonids most familiar to the layman, at least through the medium of books. Some such as *Rhyssa persuasoria* (Linnaeus) and *Megarhyssa* species are frequently illustrated as ‘typical’ ichneumon-flies, presumably because of their large size, spectacular ovipositors and oviposition habits. The British Isles fauna comprises just two species.

Niche specificity is strikingly illustrated by members of this relatively specialised subfamily. For instance, *Rhyssa persuasoria* is associated with siricid woodwasps in coniferous trees. Infested trees may be detected by some response to the woodwasps’ fungal symbiont *Amylostereum*. Locating hosts and ovipositing onto them through a great thickness of timber is not easy and despite the impressive adaptations of rhyssines they have a remarkably high rate of ‘misses’ when drilling for hosts. *Rhyssa persuasoria*, however, is able to develop on woodwasp larvae of all sizes (sometimes already harbouring larvae of the cynipoid primary parasite *Ibalia*), woodwasp pupae and, acting almost as a pseudohyperparasite, on the larvae and pupae of *Ibalia*. It has even been reported as developing successfully on woodwasp adults still in their pupal cells.

STILBOPINAE

This subfamily is not easily characterised, despite its small size. However, the very common European species *Stilbops vetula* (Gravenhorst) has a distinctive appearance and is easily recognized. Four out of the five European species of *Stilbops* occur in the British Isles. As far as is known Stilbopinae are solitary koinobiont endoparasitoids of Incurvariidae (Lepidoptera). The egg is laid in the host egg and the adult emerges from the host cocoon. Adults of *S. vetula* are often found in deciduous woodland in late April and May swarming around fresh foliage. It attacks *Adela reaumerella* (Linnaeus), although its life cycle is known only in outline. Female *Stilbops ruficornis* (Gravenhorst) have been observed probing with their ovipositor, which is much longer than in other species of the genus, in the flower heads of *Knautia arvensis* and ovipositing into the eggs of *Nemophora metallica* (Poda) concealed there. The

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

parasitised host overwinters as a part grown larva and continues feeding in the following spring. *Panteles schutzeana* is a parasite of the very local moth *Lampronia fuscata* (Tengström) (Incurvariidae), which makes galls in birch twigs.

AWS) (unpublished).

TERSILOCHINAE

The Tersilochinae is a medium-sized subfamily comprising small, inconspicuous species. Most are koinobiont endoparasites of larval Coleoptera, including economically important pests such as the weevils and ‘flower beetles’ which damage oil seed rape. The known exceptions include *Gelanes* species, which have been reared in North America and Britain from larvae of sawflies of the genus *Xyela*

(Hymenoptera: Xyelidae). The Coleoptera reliably recorded as hosts have a variety of habits and include members of the families Byrrhidae, Cisidae, Chrysomelidae, Curculionidae, Melandryidae, Nitidulidae, Scolytidae and Staphylinidae. The larvae of most of the known hosts are concealed; often in plant tissue. *Barycnemis* species, which have rather robust ovipositors, attack larvae in the soil. A common factor linking hosts is that they construct a pupal chamber or cocoon in the soil. All species develop as solitary internal parasites.

Most of our knowledge of the biology of tersilochines comes from investigations made in connection with their parasitism of pest beetles. The crops in Europe in which tersilochine species help to control populations of pests include oil seed rape and its relatives. A number of workers have assessed the roles tersilochines play in these situations but little has been done to enhance their effect. There are striking differences in egg placement and development between the species which have been investigated. The egg may be deposited free in the haemocoel of the host, attached to an internal organ, or placed in the body wall. The egg of *Tersilochus heterocerus* (Thomson) is simple in shape and has a smooth, blackish chorion whereas that of *Phradis morionellus* (Holmgren) has a colourless chorion with a dense covering of minute spines. The eggs of *Diaparsis temporalis* Horstmann and *D. carinifer* (Thomson) have a 'knob-like' protrusion on one side, by means of which they are attached to tissue within the thoracic region of the host. Some individuals of *D. temporalis* produced eggs without, or with only a rudimentary, protrusion and no protrusion is mentioned as being present in *Tersilochus tripartitus* (Brischke), the eggs of which are attached usually to the malpighian tubules of its host. In the South American species *Stethantyx parkeri* (Blanchard) the egg has a weak protrusion and is deposited in the body wall of the host between the cuticle and the epidermis. Incubation usually takes only a few days, and at least in *T. tripartitus* and *P. morionellus* is accompanied by a large increase in the volume of the egg. In *Diaparsis* and *Tersilochus* hatching is rapid but in *S. parkeri* development of the posterior part of the embryo is slower than that of the anterior and the larva slowly issues from the

egg over a period of about 13 days as development proceeds. In *T. heterocerus* the larva hatches only when the host is fully fed and about to enter the soil to pupate.

The first instar larva is of the caudate type and in *Diaparsis* and *S. parkeri* it bears two pairs of pseudopods near its posterior end. The first instar larva feeds but does not moult to the second instar until the host larva is fully-grown and has constructed its pupal cell in the ground. Development of the parasite is then rapid and it is fully-grown within a few days. The last instar larva of *T. conotracheli* leaves the host and completes its feeding externally. The fully-grown parasite larva spins a cocoon within the host pupal cell. The cocoons of tersilochines usually have a distinct median band, for example the cocoon of *Diaparsis stramineipes* (Brischke) is papery in texture and light brown, with a thickened median band of a creamy colour. The adult emerges by biting a small round hole in the end.

Most of the European species which have been studied are univoltine. In *Tersilochus* and *Phradis* pupation immediately follows cocoon formation and the pupal period is brief, but the adult remains quiescent within the cocoon until the following year. In *Diaparsis* the fully-grown larva overwinters within its cocoon and pupation does not take place until the following spring. There is evidence that species of *Aneuclis* are multivoltine and that *A. melanarius* (Holmgren) overwinters as a first instar larva in larvae of certain hosts whilst utilizing a different host for its summer generation(s).

Superparasitism appears to occur in nature to a relatively large extent and is mentioned by several authors. In all cases investigated only one individual ever survived. In *Stethantyx parkeri* excess first instar larvae were found dead within the host and usually bore signs of physical injury to the posterior part of the body. In *Tersilochus conotracheli*, in cases of superparasitism, while one larva remained healthy all others were found dead and enclosed by a mass of cells.

Successful encapsulation of eggs and larvae sometimes occurs in the normal host of *Diaparsis* species and perhaps indicates a barely adequate level of physiological adaptation on the part of the parasite. *T. heterocerus* usually failed to complete its

development when other parasites were present and that even in the absence of other parasites some eggs failed to hatch and first instar larvae died. He also encountered 'numerous' overwintering host adults with one to three black egg-shells embedded in the fat-body, showing unsuccessful parasitism.

TRYPHONINAE

This subfamily is best represented in the north temperate regions of the world, as are its main hosts the sawflies. However, some genera attack Lepidoptera and one of these, *Netelia*, is world-wide in distribution and is among the largest ichneumonid genera. Overall the Tryphoninae is a moderately large subfamily. All of its tribes are very distinct and there is a possibility that it is not a monophyletic grouping. All six tribes are represented in the British Isles and we have about 160 species.

This subfamily constitutes by far the largest assemblage of koinobiont ectoparasitoids. Unlike the other successful ectoparasitoid groups, tryphonines have avoided the need for adult females to invest heavily in gaining access to hosts concealed in protective structures such as cocoons. A specialised egg stage has been the key to their success, allowing them to exploit more easily accessible stages of their hosts. The egg is attached to the free-living larval host, but there is no significant development of the parasite until the host has constructed its cocoon. An egg on the outside of a fully active, free-living host must be securely attached; safe from destruction or dislodgement by the host; protected from damage while the host is moving about or entering the soil to make a cocoon; and resistant to desiccation.

The egg is secured in position by an anchor which passes through the host's integument. The anchors range from the relatively simple, coiled and thread-like, to

very complex structures which partially enclose the egg and leave little of it protruding above the surface of the host's body. Placement of the anchor is achieved by means of a specialised mode of oviposition. In contrast to almost all other ichneumonids the egg of tryphonines does not pass down the lumen of the ovipositor, only the anchor does so while the body of the egg is suspended below the ovipositor valves. The eggs are usually attached to parts of the thoracic segments or head of the symphytan or lepidopteran caterpillar, where they cannot be reached by its mandibles. However, destruction of eggs by caterpillars has been observed. Like the anchors themselves the preferred oviposition sites vary between species. In one extreme case, *Erromenus calcator* (Müller), the female oviposits through the host's anal opening and attaches the egg to the wall of the hind gut. Curiously, an almost identical egg placement strategy is used by another, completely unrelated ichneumonid, *Chorinaeus funebris* (Gravenhorst), of the subfamily Metopiinae. Tryphonine eggs have a tough, resistant chorion which presumably protects them from mechanical damage and desiccation. The chorion is often dark, almost black, and in some cases its surface has a strong distinctive microsculpture.

With a few possible exceptions, species of the tribes Tryphonini and Exenterini have sawflies of the superfamily Tenthredinoidea as hosts. The hosts of the Exenterini are all tenthredinids and diprionids. A single specimen of *Grypocentrus* is said to have been reared from an eriocraniid lepidopteran on birch, the larval habits of which parallel those of the leaf-mining sawflies of the tribe Fenusiini, the usual hosts of this genus. The significance of an isolated record of this kind is difficult to assess.

The tribe Phytodietini includes only two genera - *Netelia*, with an extremely large number of species, and *Phytodietus*, with relatively few. Both are world-wide in distribution. Species of *Netelia* are active at night and have the 'ophionoid facies' typical of such ichneumonids. *Netelia* females have a relatively short, sharply pointed ovipositor and can inflict a painful sting if not handled with care. All members of the tribe attack Lepidoptera. The egg stalk is long and loosely coiled, and does not have a specialised anchor at its tip. When first laid the stalk is elastic but later becomes rigid,

holding the egg firmly to the host's skin.

There is relatively little detailed information on the biology of the small tribe Oedemopsini. Species of *Eclytus* attack sawflies (Argidae and Nematinae (Tenthredinidae)) while other genera, as far as is known, have lepidopterous hosts. *Eclytus* also lacks the slightly swollen, weakly sclerotised area found part way along the lower valves of the ovipositor in other oedemopsine genera. It seems that this may be the place where the body of the egg emerges. However, this requires further investigation and confirmation. Also, the eggs of oedemopsines are generally much smaller than those of other tryphonines. The lepidopterous hosts of the tribe are quite diverse, but individual species appear to have well-defined regular host associations with particular families (for example, Tortricidae or Coleophoridae) with occasional extension of host usage into species of other families found in the same microhabitats. Oedemopsines are usually solitary but there is at least one instance of successful development of a brood of two *Hercus fontinalis*.

Three tribes of the Tryphoninae each comprise a single genus with very few species. *Sphinctus serotinus* (Gravenhorst) is the only European representative of the tribe Sphinctini. It is quite distinctive in appearance, mainly black and yellow in colour. It parasitises the limacodid moth *Apoda limacodes* (Hufnagel). The genus *Idiogramma*, which forms the tribe Idiogrammatini, is of particular interest because it parasitises the primitive sawfly genus *Xyela* and because the adult has elongate exodont mandibles. The best known ichneumonoids with exodont mandibles are the alysiine braconids, which use them principally in assisting their escape from the host's puparium and the substrate in which it is situated. The larvae of *Xyela* feed in the staminate cones of *Pinus* and the mandibles of *Idiogramma* may be used to separate the surrounding bracts during the search for a host larva.

Eclytini

Ireland (Kerrich, 1952: p. 458 as *Anisoctenion*).

***Kristotomus triangulatorius* (Gravenhorst, 1829)**

MAYO (W.): Old Head, ♂ 21 May 1942, AWS (NMI); WICKLOW: Devil's Glen, ♀ 23 April 1929, AWS; Glenmore Castle, ♀ 16 June 1934, AWS; Powerscourt Deerpark, 2♂♂ 27 May 1932, on oak *Quercus*, AWS; Powerscourt Demense, 2♂♂ 25 May 1932, on oak *Quercus*, AWS (NMI) (all Kerrich, 1952: p. 327 as *Anisoctenion*).

Ireland (Kerrich, 1952: p. 458 as *Anisoctenion*; Jussila, 1967: p. 108).

***Smicroplectrus heinrichi* Kerrich, 1952**

DUBLIN: Dublin district (dist.), ♀ emerged *circa* 4 May 1932, *ex* sawfly larva, G. C. Scott; Glenasmole, ♂ 23 May 1930, 2♂♂ 3 June 1934, ♂ 21 May 1939 (paratype, NMI), AWS; KILDARE: Sallins, ♀ 17 May 1933, AWS (paratype, NMI) (all Kerrich, 1952: p. 409); MAYO (W.): Old Head, ♂3♀♀ (one the type), 28 May 1942, (paratype, NMI), AWS (Kerrich, 1952: p. 409; Fitton, 1976: p. 336 holotype ♀ (BMNH)); WICKLOW: Athdown, ♂ 1 May 1933, J. F. Perkins; George's Bridge, ♂ 1 May 1949, AWS (Kerrich, 1952: p. 409 I first received this species in good series from Ireland from A. W. Stelfox).

Ireland (Kerrich, 1952: p. 458).

[*Smicroplectrus quinquecinctus* (Gravenhorst, 1820)

synonym *Smicroplectrus trianguligena* Kerrich, 1952

ARMAGH: Poyntzpass, June, on the hill, WFJ (Johnson, 1915: p. 132; Kerrich, 1952: p. 397 The Irish record of this species (W. F. Johnson, 1915: p.132) is based on a male of *Acrotomus succinctus*); DUBLIN: Glenasmole, ♂ 21 May 1939, AWS; WICKLOW: George's Bridge, ♂ 19 May 1940; Powerscourt, 2♂♂ emerged 4-11 May 1932, *ex* sawfly larvae, G. C. Scott (all Kerrich, 1952: p. 401 as *Smicroplectrus trianguligena*. Provisionally I place here four small male specimens...confirmation of the occurrence of this species in Ireland by the capture of the female is much to be

desired).

Ireland (Kerrick, 1952: p. 458 record rejected; Kerrich, 1952: p. 458 as *Smicroplectrus trianguligena*. Record requiring confirmation).

According to a notation by A. W. Stelfox on page 200 in the National Museum of Ireland's copy of Morley (1911b), the above record is an error. The specimen is a ♂ *Aerotomus succinctus* fide Kerrich, 1947). This species is given as certain in Broad (2006)]

Oedemopsini

***Cladeutes discedens* (Woldstedt, 1874)**

synonym *Eclytus haematothorax* Strobl, 1903

DOWN: no locality (Fitton and Ficke, 1990: p. 208); Newcastle, north slope of Drinahilly, ♂ 8 July 1964, ♂ 24 July 1964, ♂ 2 August 1964 (BMNH), ♂ 6 August 1964, taken on the leaves of the same laurel *Prunus laurocerasus* bush, AWS; Tollymore Park, ♀ 12 May 1961, swept off Scots pine *Pinus sylvestris*, AWS; WICKLOW: Ballylusk, near Ashford, ♀ 21 April 1933, beaten from hazel *Corylus* just coming into leaf, AWS; The Deputy's Pass, ♀ 24 July 1929 and ♀ 12 March 1933, the latter beaten from hazel *Corylus* just coming into leaf, AWS (Stelfox, 1966a: p. 510 as *Eclytus discedens*).

***Hercus fontinalis* (Holmgren, 1857)**

ARMAGH: Poyntzpass, June, in back avenue, WFJ (Johnson, 1915: p. 132 as *Eclytus*); DOWN: no locality {Tollymore Park (Pk), ♀ 8 September 1965, AWS (NMI) (det. AWS and conf. RWC)}; DUBLIN: no locality; LOUTH: no locality; MAYO (West): no locality; MEATH: no locality; WICKLOW: no locality (all Stelfox, 1966a: p. 511 as *Eclytus*. 30-40 specimens...the majority coming from Co. Wicklow...on dates between 19th April and 29th September).

Ireland (Fitton and Ficken, 1990: p. 209 uncommon but widely distributed throughout).

***Oedemopsis scabricula* (Gravenhorst, 1829)**

MAYO: Portlea, Clare Island, ♀♀ July 1910, swept at "the wood", CM (NMI) (conf.

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

L. Ficken) (Morley, 1911a: p. 13 as *Oedematopsis*).

Ireland (♂♀ Haliday Collection (NMI) (det. L. Ficken as *Hybophanes*)).

Phytodietini

Netelia (Bessobates) cristata (Thomson, 1888)

DOWN: Rostrevor, ♀ 5 and 6 September 1929, in house at light, WFJ (NMI) (Johnson, 1930: p. 158 as *Paniscus*).

****Netelia (Bessobates) latungula (Thomson, 1888)* New to Ireland**

ANTRIM: Murlough Bay (B.), 2 June 1939, AWS (NMI); DOWN: Tollymore Park (Pk), 19 May 1957 and 16 May 1961, AWS (NMI); MAYO: Old Head, 2 June 1942, AWS (NMI); SLIGO: Trawalua, 12 June 1959, AWS (NMI); WICKLOW: Athdown, 2 May 1948, AWS (NMI); Devil's Glen, 20 May 1932, AWS (NMI).

****Netelia (Bessobates) virgata (Geoffroy, 1790)* New to Ireland**

DOWN: Newcastle, 11 September 1955, AWS (NMI); Rostrevor, August 1930, WFJ (NMI); MAYO: Old Head, 14 September 1941, AWS (NMI); same locality, 26 June 1942, "under sack", Donald Wallace (NMI); WICKLOW: Clara, 8 May 1940, AWS (NMI); Imaal, 28 July 1940, AWS (NMI).

Netelia (Netelia) fuscicornis (Holmgren, 1860)

synonym *Netelia gracilipes* (Thomson, 1888)

DOWN: Greencastle, ♂ August 1930, in field, Mrs Johnson (NMI) (Johnson, 1931c: p. 141 as *Paniscus*); Rostrevor, October 1922, to light in house, WFJ (NMI) (Johnson, 1923: p. 38 as *Paniscus gracilipes*); same locality, ♂♂ 13 August 1929 and 23 September 1929, house and vicarage at light, WFJ (NMI) (Johnson, 1929: p. 158 as *Paniscus gracilipes*); same locality, ♂ 10 June 1929, vicarage at light, WFJ (NMI) (Johnson, 1930: p. 158 as *Paniscus*).

Netelia (Netelia) melanura (Thomson, 1888)

ARMAGH: Poyntzpass, in Acton Wood, June, on the wing, not a common species, WFJ (NMI) (Johnson, 1916a: p. 21 as *Paniscus*); Poyntzpass field, September, at willows *Salix*, WFJ (NMI) (Johnson, 1920a: p. 10 as *Paniscus*); DOWN: Dundrum, ♂

June 1926, WFJ (Johnson, 1927: p. 161 as *Paniscus*); Rostrevor, ♀ 4 July 1930, vicarage, WFJ (NMI) (Johnson, 1931a: p. 54 as *Paniscus*).

****Netelia (Netelia) ocellaris* (Thomson, 1888) New to Ireland**

DOWN: Rostrevor, 17 September 1931, 15 July and 9 September 1932, WFJ (NMI); KERRY: Killarney, 1927, EFB (NMI) (det. AWS).

***Netelia (Netelia) testacea* (Gravenhorst, 1829)**

DONEGAL: Portnoo sandhills, WFJ (Johnson, 1920a: p. 10 as *Paniscus*); DOWN: Newcastle, ♀ September 1926, in window, WFJ (NMI) (Johnson, 1927: p. 161 as *Paniscus*).

***Netelia (Paropheltes) tarsatus* (Brischke, 1880)**

DOWN: Rostrevor, ♂♂ 20 and 27 May 1929, woods, WFJ (NMI) (Johnson, 1930: p. 158 as *Paniscus (Parabatus)*); MAYO: Clare Island, ♀ September 1910, WFJ (Morley, 1911a: p. 14 as *Paniscus*).

[*Phytodietus (Phytodietus) ?arcuatorius* (Thunberg, 1824)

synonym *Phytodietus crassitarsis* Thomson, 1877

DUBLIN: Glenasmole, ♀ 13 June 1933, JFP (BMNH) (det GKK as *?crassitarsis*) Ireland (Broad, 2006 compared to type by GKK and found to differ).]

***Phytodietus (Phytodietus) astutus* Gravenhorst, 1829**

synonym *Phytodietus (Phytodietus) obscurus* Desvignes, 1856

DONEGAL: Portnoo, cliff, June, WFJ (NMI) (det. AR) (Johnson, 1921a: p. 106 as *Phytodietus obscurus*); DOWN: Rostrevor, June 1925, WFJ (NMI); LOUTH: Termonfeckin, July 1924, WFJ (both Johnson, 1927: p. 160 as *Phytodietus obscurus*. ♂♀).

***Phytodietus (Phytodietus) gelitorius* (Thunberg, 1824)**

synonym *Phytodietus coryphaeus* Gravenhorst, 1829

ARMAGH: Poyntzpass, August, garden, WFJ (NMI) (Johnson, 1921a: p. 106 as *Phytodietus coryphaeus*. A dark form); DOWN: Dundrum, ♀♀ June and August 1926, WFJ (NMI) (Johnson, 1927: p. 160 as *Phytodietus coryphaeus*); Greencastle, ♂ 15 August 1930, roadside, WFJ (NMI) (Johnson, 1931c: p. 140 as *Phytodietus*

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

coryphaeus); Newcastle, ♀ 27 August, WFJ (NMI) (Johnson, 1929: p. 136); Rostrevor, ♀ [?39] 31 May 1929, woods, WFJ (NMI) (Johnson, 1930: p. 157 as *Phytodiaetus coryphaeus*. Var. *vertex* immaculate); KERRY (South): no locality, June 1902 (Saunders *et al.*, 1903: p. 68 as *Phytodietus coryphaeus*; Morley, 1908a: p. 244 as *Phytodietus coryphaeus*); LOUTH: Carlingford, June 1921, WFJ (NMI) (Johnson, 1922a: p. 17 as *Phytodietus coryphaeus*); Termonfeckin, August 1924, WFJ (Johnson, 1927: p. 160 as *Phytodietus coryphaeus*. Var., hind coxae entirely black); MAYO: near Westport, 2♂♂ July 1911, JNH (Morley, 1911a: p. 13 as *Phytodiaetus coryphaeus*).

Phytodietus (Phytodietus) geniculatus Thomson, 1877

DOWN: Newcastle, ♀♀ 7 and 13 June, flying round young oak *Quercus* trees, WFJ (NMI) (Johnson, 1929: p. 136).

Phytodietus (Phytodietus) polyzonias (Forster, 1771)

DONEGAL: New Lough, Dunfanaghy, ♂ 11 June 1955, AWS (NMI) (det. AWS) (unpublished); WEXFORD: Courtown (Courten), 2♀♀ 8 September 1893, AB (Morley, 1908a: p. 242).

Tryphonini

****Cosmoconus ceratophorus (Thomson, 1888)***

New to Ireland

DOWN: Newcastle, 4 September 1955, AWS (NMI); KILDARE: Landenstown, 3 August 1940 and 4 August 1949, AWS (NMI); WICKLOW: Devil's Glen, 24 July 1940, AWS (NMI); Woodend, 10 August 1956, AWS (NMI).

Cosmoconus elongator (Fabricius, 1775)

ANTRIM: Killead, ♀ August 1923, WFJ (Johnson, 1927: p. 160 as *Tryphon*); ARMAGH: Poyntpass, ♀ 30 July 1909, WFJ (NMI) (Johnson, 1912a: p. 79 as *Tryphon*); Richhill, ♂ 14 September 1909, HLO (NMI); DONEGAL: Coolmore, {21, 24 and 30} August and {5 and 9} September 1912, WFJ (NMI) (Johnson, 1913: p. 140); Coolmore on Owen's Fort, {14} September 1916, at flowers of wild carrot *Daucus carota*, WFJ (NMI) (Johnson, 1917a: p. 39 as *Tryphon*); Portnoo, September 1917, WFJ (NMI) (Johnson, 1918: p. 109 as *Tryphon*); DOWN: Dundrum, ♀ July

1926, WFJ (Johnson, 1927: p. 160 as *Tryphon*); Greencastle, ♀ August 1930, common on roadside, WFJ (Johnson, 1931c: p. 140 as *Casmoconus*); Newcastle, ♀♀ 9, 17 and 27 August, WFJ (NMI) (Johnson, 1929: p. 137); Rostrevor, ♀ September 1923, WFJ (NMI) (Johnson, 1927: p. 160 as *Tryphon*); Warrenpoint, ♀♀ 16 August and 15 September, WFJ (Johnson, 1929: p. 137 as *Coeloconus*); KERRY: Kenmare, ♀ 7 July 1901, JWY (Morley, 1902: p. 55 as *Tryphon*; Morley, 1911b: p. 180 as *Tryphon*); LOUTH: Termonfeckin, ♀ July 1924, WFJ (NMI) (Johnson, 1927: p. 160 as *Tryphon*); WATERFORD: Cappoquin, Dungarvan, ♀♀ 14 August 1928, AWS (NMI) (det. AWS as *Tryphon*) (unpublished); WEXFORD: Enniscorthy; Kilmore (both Morley, 1911b: p. 180 as *Tryphon*).

July 1910, CM (NMI) (Morley, 1911a: p. 14).

XORIDINAE

This is one of the smaller subfamilies of the Ichneumonidae with just under 200 described species. Currently the species are grouped into four genera, three of which are restricted to the north temperate zone while the fourth and largest, *Xorides*, is world-wide in distribution. Thirteen species representing three genera have been found in the British Isles.

Xoridine larvae develop as idiobiont external parasites of immature stages of wood-boring beetles, and possibly also woodwasps (Hymenoptera: Siricoidea). It seems certain that a wide spectrum of beetle hosts, living in woody tissue of both angiosperms and gymnosperms, is exploited. However, exact host relations are hard to establish in such situations and comparatively little is known in detail about host ranges of individual species and their more general biology. Although the larval stage of the host is probably most frequently attacked they are known to consume pupae and possibly pharate adults. Most species are probably solitary parasites, but at least one of the British Isles species, *Ischnoceros rusticus* (Geoffroy), is usually gregarious (broods of 1-5). One species-group of *Odontocolon* has wingless and brachypterous, as well as fully-winged, forms in North America, but the significance of these adaptations is unknown.

The female of *Xorides brachylabis* (Kriechbaumer) oviposits through the bark, using her ovipositor to drill into the host's gallery in the sapwood. After initial insertion of the ovipositor tip into the bark the sheaths are withdrawn and resume their normal position in line with the body. When the ovipositor has penetrated the host's gallery, which may be accomplished in about 15 minutes, the female stands motionless for a further period, perhaps 5 to 15 minutes. After egg laying the ovipositor is withdrawn by short jerks of the metasoma. The female then cleans herself and stands at the oviposition site for a few minutes, the whole oviposition sequence taking less than one hour. The host is always accurately located and a single egg placed on (and apparently stuck to) the cerambycid host larva. Only exceptionally is an egg found near, rather than on, a host. It is very likely that the host is stung

before the egg is laid because it becomes immobile; has a reduced heart rate; and if the chorionic egg fails to hatch dies after several weeks. The elongate fusiform egg has a short pedicel at one end. Incubation takes about 8 days and the newly hatched larva, after spending an hour or two moving about on the body of the host, begins feeding, burying its mandibles in the integument and sucking body fluids. The fully-grown larva constructs a cocoon in the host's gallery. Construction occupies from 3 to 5 days and the completed cocoon is thin-walled, transparent, rounded at both ends, and about twice the length and twice the diameter of the larva.

The fourth instar larva overwinters in the cocoon without any obvious change until sometime between the following April and September, when it assumes a prepupal form. The pupal stage itself is very short, lasting 9 or 10 days, although the adult does not leave the cocoon for a further 5 days. The adult uses its mandibles to gnaw through the wood and bark to escape.

In several places...I believe I have proof that it is parasitic on the larva of the beetle *Rhagium bifasciatum* Fabr. (Coleoptera: Cerambycidae). Towards the close of summer the parasites leave the *Rhagium* larvae and spin dirty white, very elongate cocoons in clusters beneath the loose bark of rotting stumps and logs, from which the imagines emerge the following year from May to July. I have taken as many as eight or ten cocoons in one cluster, but I have no evidence how many parasites can be nourished by one host larva. Occasionally, I have found the cocoons singly). There is a large number of specimens in NMI and only a sample is given above.

Plate 1. *Lampronota crenicornis*.

Plate 2. *Mesochorus sericans*.

Plate 3. *Banchus farrani*.

The colour plates by John Curtis

Plate 1. Number 407. *Lampronota crenicornis* Curtis, 1832.

Current name: *Cylloceria melancholica* (Gravenhorst, 1829)

“In the Cabinets of Mr. Haliday and the Author”. “Mr. Haliday says “It was found from the early part of August to the middle of September”.

Plate 2. Number 464. *Mesochorus sericans* Curtis, 1833

Current name: *Astiphromma splenium* (Curtis, 1833)

“In the Cabinet of Mr. Haliday”. “Taken by Mr. Haliday, I believe, near Belfast”.

Plate 3. Number 588. *Banchus farrani* Curtis, 1836

Current name: *Banchus volutatorius* (Linnaeus, 1758)

“As I cannot consider this a variety I have named it after my esteemed friend Dr. Farran of Dublin, who was of our party in Connemara the end of last July, when I found a specimen flying about the plant figured, on the sand-hills near Roundstone”.

The quotes are from the text accompanying the plates.

Occ. Publ. Ir. biogeog. Soc. No. 10 (2007)

OTHER PUBLICATIONS AVAILABLE FROM THE IRISH BIOGEOGRAPHICAL SOCIETY

OCCASIONAL PUBLICATIONS OF THE IRISH BIOGEOGRAPHICAL SOCIETY (A5 FORMAT)

Number 1. *Proceedings of The Postglacial Colonization Conference*

D. P. Sleeman, R. J. Devoy and P. C. Woodman (editors)

Published 1986. 88pp. Price €4 (Please add €4 for postage outside Ireland for each publication).

Number 2. *Biogeography of Ireland: past, present and future*

M. J. Costello and K. S. Kelly (editors)

Published 1993. 149pp. Price €15.

Number 3. *A checklist of Irish aquatic insects*

P. Ashe, J. P. O'Connor and D. A. Murray

Published 1998. 80pp. Price €7.

Number 4. *A catalogue of the Irish Braconidae (Hymenoptera: Ichneumonoidea)*

J. P. O'Connor, R. Nash and C. van Achterberg

Published 1999. 123pp. Price €6.

Number 5. *The distribution of the Ephemeroptera in Ireland*

M. Kelly-Quinn and J. J. Bracken

Published 2000. 223pp. Price €12.

Number 6. *A catalogue of the Irish Chalcidoidea (Hymenoptera)*

J. P. O'Connor, R. Nash and Z. Bouček

Published 2000. 135pp. Price €10.

Number 7. *A catalogue of the Irish Platygastroidea and Proctotrupoidea (Hymenoptera)*

J. P. O'Connor, R. Nash, D. G. Notton and N. D. M. Fergusson

Published 2004. 110pp. Price €10.

Number 8. *A catalogue and index of the publications of the Irish Biogeographical Society (1977-2004)*

J. P. O'Connor

Published 2005. 74pp. Price €10.

Number 9. *Fauna and flora of Atlantic islands. Proceedings of the 5th international symposium on the fauna and flora of the Atlantic islands, Dublin 24 -27 August 2004.*

Edited by T. J. Hayden, D. A. Murray and J. P. O'Connor

Published 2006. 213pp. Price €10.

BULLETIN OF THE IRISH BIOGEOGRAPHICAL SOCIETY (A5 FORMAT)

The Bulletin is sent free to all members. The annual membership fee is €15 or £10. To-date, 30 volumes have been published. Back issues may be purchased for €15 or £10. Discounts are given for large orders.

MACRO SERIES OF THE IRISH BIOGEOGRAPHICAL SOCIETY (A4 FORMAT)

First Supplement to A Bibliography of Irish Entomology

James P. O'Connor, Patrick Ashe and John Walsh

Published in association with The National Museum of Ireland. 2005. 186pp. Price €30.

An annotated checklist of the Irish butterflies and moths (Lepidoptera)

K. G. M. Bond, R. Nash and J. P. O'Connor

Published in association with The National Museum of Ireland. 2006. 177pp. Price €25.

PAYMENT

Orders should be sent to The Irish Biogeographical Society c/o Dr J. P. O'Connor, National Museum of Ireland, Kildare Street, Dublin 2, Ireland. Cheques should be made payable to "The Irish Biogeographical Society".
