Key indicators

Single-crystal X-ray study
 $T = 273$ K
Mean $\sigma(\text{C}-\text{C}) = 0.002$ Å
 R factor = 0.025
 wR factor = 0.071
Data-to-parameter ratio = 25.5For details of how these key indicators were
automatically derived from the article, see
<http://journals.iucr.org/e>. $\alpha,\alpha,4$ -Trichloro- α -phenyl- o -tolyl dichlorophosphateThe reaction of 5-chloro-2-hydroxybenzophenone with phosphorus pentachloride yielded the title compound, $\text{C}_{13}\text{H}_8\text{Cl}_5\text{O}_2\text{P}$. This compound can then be decomposed into a 2,5-dichlorobenzophenone by heating. There are two molecules of the title compound in the asymmetric unit.

Comment

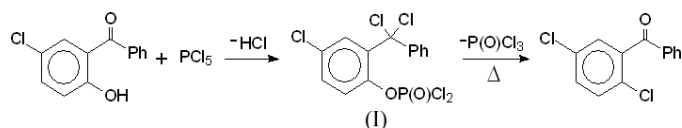

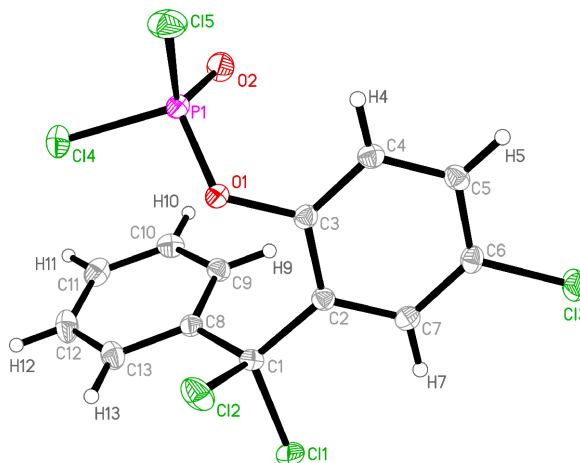

In general, phenols are known to react with phosphorus pentachloride to form moisture-sensitive products having a PhOPCl_4 type of structure (Anschütz & Emery, 1887, 1889). It has recently been demonstrated (Pinkus *et al.*, 2004*a,b*) that 2-hydroxyphenolic esters undergo a different sort of reaction that produces a relatively moisture-stable product. In this reaction, the carbonyl O atom is exchanged for two Cl atoms to form a dichloromethylene and an $\text{OP}(\text{O})\text{Cl}_2$ group. On the basis of spectroscopic evidence, this reaction was also reported to occur when 5-chloro-2-hydroxybenzophenone was reacted with PCl_5 (Pinkus, Ma *et al.*, 2004, and references therein).It is definitively shown here, by its crystal structure, that the reaction product is indeed analogous to those of the 2-hydroxyphenolic ester reactions. Compound (I) was obtained by reaction of 5-chloro-2-hydroxybenzophenone with PCl_5 , giving off an equivalent of HCl for each equivalent of benzophenone, as shown in the scheme. It has also been

Figure 1
The molecular structure of one of the molecules of the asymmetric unit of (I), with displacement ellipsoids drawn at the 50% probability level

shown that upon heating, loss of $\text{P}(\text{O})\text{Cl}_3$ occurs leaving a 2,5-dichlorinated benzophenone (Pinkus, Klausmeyer *et al.*, 2004), making the title compound a convenient intermediate en route to 2-chlorobenzophenones.

The molecular structure of (I) (Fig. 1) shows bond lengths and angles typical of aromatic chlorohydrocarbon atoms. There are two molecules of (I) in the asymmetric unit, showing slight differences in bond lengths and angles about the rings and a twisting of the $\text{OP}(\text{O})\text{Cl}_2$ substituent.

Experimental

Compound (I) was prepared as reported in Pinkus & Meng (1966) by reaction of 5-chloro-2-hydroxybenzophenone with phosphorus pentachloride. Single crystals of (I) were obtained by cooling of a hot cyclohexane solution.

Crystal data
