Package 'twang'

July 2, 2014

Version 1.4-0

Date 2014-06-14

Title Toolkit for Weighting and Analysis of Nonequivalent Groups

Author Greg Ridgeway, Dan McCaffrey, Andrew Morral, Beth Ann, Lane Burgette <burgette@rand.org>

Maintainer Lane Burgette <burgette@rand.org>

Depends R (>= 2.10), gbm (>= 1.5-3), survey, xtable, latticeExtra

Description This package offers functions for propensity score estimating and weighting, nonresponse weighting, and diagnosis of the weights. This package was originally developed by Drs. Ridgeway, McCaffrey, and Morral. Burgette, Griffin and McCaffrey updated the package in 2011-13.

License GPL (>= 2)

R topics documented:

AOD *Subset of Alcohol and Other Drug treatment data*

Description

A small subset of the data from McCaffrey et al. (2013).

Usage

```
data(AOD)
```

Format

A data frame with 600 observations on the following 10 variables.

`treat` Treatment that each study subject received. Either community, metcbt5, or scy.

`suf12` outcome variable, substance use frequency at 12 month follow-up

`illact` covariate, illicit activities scale

`crimjust` covariate, criminal justice involvement

`subprob` covariate, substance use problem scale

`subdep` covariate, substance use dependence scale

`white` 1 if non-Hispanic white, 0 otherwise

References

McCaffrey, DF, BA Griffin, D Almirall, ME Slaughter, R Ramchand and LF Burgette (2013). A tutorial on propensity score estimation for multiple treatments using generalized boosted models. Statistics in Medicine.

bal.stat *Calculate weighted balance statistics*

Description

bal.stat compares the treatment and control subjects by means, standard deviations, effect size, and KS statistics

Usage

```
bal.stat(data,
         vars = NULL,
         treat.var,
         w.all,
         sampw,
         get.means = TRUE,
         get.ks = TRUE,
         na.action = "level",
         estimand,
         multinom)
```

Arguments

data	a data frame containing the data
vars	a vector of character strings with the names of the variables on which the function will assess the balance
treat.var	the name of the treatment variable
w.all	observation weights (e.g. propensity score weights, sampling weights, or both)
sampw	sampling weights. These are passed in addition to w.all because the "unweighted" results shoud be adjusted for sample weights (though not propensity score weights).
get.means	logical. If TRUE then bal.stat will compute means and variances
get.ks	logical. If TRUE then bal.stat will compute KS statistics
na.action	a character string indicating how bal.stat should handle missing values. Current options are "level", "exclude", or "lowest"
estimand	either "ATT" or "ATE"
multinom	TRUE if used for multinomial propensity scores.

Details

bal.stat calls auxiliary functions for each variable and assembles the results in a table

Value

get.means and get.ks manipulate the inclusion of certain columns in the returned result.

See Also

The example for ps contains an example of the use of bal.table

---

bal.table *Compute balance table*

Description

Extract the balance table from ps, dx.wts, and mnps objects

Usage

```
bal.table(x, digits = 3, collapse.to = c("pair","covariate","stop.method")[1])
```

Arguments

x	a ps or dx.wts object
digits	The number of digits that the numerical entries should be rounded to.
collapse.to	For mnps ATE objects, the comparisons can be given for all pairs (default), summarized by pre-treatment covariate and stop.method, or as a single summary for each stop.method.

Details

bal.table is a generic function for extracting balance tables from ps and dx.wts objects. These objects usually have several sets of candidate weights, one for an unweighted analysis and perhaps several stop.methods. bal.table will return a table for each set of weights combined into a list. Each list component will be named as given in the x, usually the name of the stop.method. The balance table labeled "unw" indicates the unweighted analysis.

Value

Returns a data frame containing the balance information.

tx.mn	The mean of the treatment group
tx.sd	The standard deviation of the treatment group
ct.mn	The mean of the control group
ct.sd	The standard deviation of the control group
std.eff.sz	The standardized effect size, (tx.mn-ct.mn)/tx.sd. If tx.sd is small or 0, the standardized effect size can be large or INF. Therefore standardized effect sizes greater than 500 are set to NA
stat	the t-statistic for numeric variables and the chi-square statistic for continuous variables
p	the p-value for the test associated with stat
ks	the KS statistic
ks.pval	the KS p-value computed using the analytic approximation, which does not necessarily work well with a lot of ties

See Also

The example for ps contains an example of the use of bal.table

---

boxplot.mnps *Boxplots for mnps objects*

Description

This function produces a collection of diagnostic plots for mnps objects.

Usage

```
## S3 method for class 'mnps'
boxplot(x, stop.method = NULL, color = TRUE, ...)
```

Arguments

x	A ps object
stop.method	Only 1 stop.method can be presented at a time for mnps objects. Use a numeric indicator of which stop.method (among those specified when fitting the mnps object) should be used.
color	If FALSE, a grayscale figure will be returned.
...	Additional arguments that may be passed to the underlying lattice package plotting functions

Details

This function produces lattice-style graphics of diagnostic plots.

References

Dan McCaffrey, G. Ridgeway, Andrew Morral (2004). "Propensity Score Estimation with Boosted Regression for Evaluating Adolescent Substance Abuse Treatment," *Psychological Methods* 9(4):403-425.

See Also

ps

boxplot.ps *Boxplots for ps objects*

Description

This function produces a collection of diagnostic plots for ps objects.

Usage

```
## S3 method for class 'ps'
boxplot(x, subset=NULL, color = TRUE, ...)
```

Arguments

x	A ps object
subset	If multiple stop.method rules were used in the ps() call, subset restricts the plots of a subset of the stopping rules that were employed. This argument expects a subset of the integers from 1 to k, if k stop.methods were used.
color	If set to FALSE, grayscale figures will be produced
...	Additional arguments that may be passed to the underlying lattice package plotting functions

Details

This function produces lattice-style graphics of diagnostic plots.

References

Dan McCaffrey, G. Ridgeway, Andrew Morral (2004). "Propensity Score Estimation with Boosted Regression for Evaluating Adolescent Substance Abuse Treatment," *Psychological Methods* 9(4):403-425.

ps

desc.wts *Diagnosis of weights*

Description

desc.wts assesses the quality of a set of weights on balancing a treatment and control group.

Usage

```
desc.wts(data,
         w,
         sampw,
         vars = NULL,
         treat.var,
         tp,
         na.action = "level",
         perm.test.iters=0,
         verbose=TRUE,
         alerts.stack,
         estimand, multinom = FALSE)
```

Arguments

data	a data frame containing the dataset
w	a vector of weights equal to nrow(data)
sampw	sampling weights, if provided
vars	a vector of variable names corresponding to data
treat.var	the name of the treatment variable
tp	a title for the method “type" used to create the weights, used to label the results
na.action	a string indicating the method for handling missing data
perm.test.iters	an non-negative integer giving the number of iterations of the permutation test for the KS statistic. If perm.test.iters=0 then the function returns an analytic approximation to the p-value. This argument is ignored is x is a ps object. Setting perm.test.iters=200 will yield precision to within 3% if the true p-value is 0.05. Use perm.test.iters=500 to be within 2%
verbose	if TRUE, lots of information will be printed to monitor the the progress of the fitting
alerts.stack	an object for collecting warnings issued during the analyses
estimand	the estimand of interest: either "ATT" or "ATE"
multinom	Indicator that weights are from a propsensity score analysis with 3 or more treatment groups.

Details

desc.wts calls bal.stat to assess covariate balance. If perm.test.iters>0 it will call bal.stat multiple times to compute Monte Carlo p-values for the KS statistics and the maximum KS statistic. It assembles the results into a list object, which usually becomes the desc component of ps objects that ps returns.

Value

See the description of the desc component of the ps object that ps returns

See Also

ps

---

dx.wts *Propensity score diagnostics*

Description

dx.wts takes a ps object or a set of propensity scores and computes diagnostics assessing covariates balance.

Usage

```
dx.wts(x,
       data,
       estimand,
       vars=NULL,
       treat.var,
       x.as.weights=TRUE,
       sampw=NULL,
       perm.test.iters=0)
```

Arguments

x	a data frame, matrix, or vector of propensity score weights or a ps object. x can also be a data frame, matrix, or vector of propensity scores if x.as.weights=FALSE
data	a data frame
estimand	the estimand of interest: either "ATT" or "ATE"
vars	a vector of character strings naming variables in data on which to assess balance
treat.var	a character string indicating which variable in data contains the 0/1 treatment group indicator
x.as.weights	TRUE or FALSE indicating whether x specifies propensity score weights or propensity scores. Ignored if x is a ps object

`sampw` optional sampling weights. If `x` is a ps object then the sampling weights should have been passed to `ps` and not specified here. `dx.wts` will issue a warning if `x` is a ps object and `sampw` is also specified

`perm.test.iters` an non-negative integer giving the number of iterations of the permutation test for the KS statistic. If `perm.test.iters=0` then the function returns an analytic approximation to the p-value. This argument is ignored is `x` is a `ps` object. Setting `perm.test.iters=200` will yield precision to within 3% if the true p-value is 0.05. Use `perm.test.iters=500` to be within 2%

Details

Creates a balance table that compares unweighted and weighted means and standard deviations, computes effect sizes, and KS statistics to assess the ability of the propensity scores to balance the treatment and control groups.

Value

Returns a list containing

`treat` the vector of 0/1 treatment assignment indicators

`desc` a nested list containing detailed diagnostic information on the weights. This includes the number of treatment and control subjects, the effective sample size, the largest KS statistic, the average absolute effect size, and the complete balance table

`summary.tab` a data frame showing balance information

`ps` the given propensity scores

`w` the given weights

`datestamp` the date and time of the call to `dx.wts`

`parameters` the parameters used when calling `dx.wts`

`alerts` text containing any warnings accumulated during the estimation

`varNames` the variable names

See Also

The example for `ps` contains an example of the use of `dx.wts`

---

egsingle *US Sustaining Effects study*

Description

A subset of the mathematics scores from the U.S. Sustaining Effects Study. The subset consists of information on 1721 students from 60 schools. This dataset is available in the `mlmRev` package.

Usage

```
data(egsingle)
```

Format

A data frame with 7230 observations on the following 12 variables.

`schoolid` a factor of school identifiers

`childid` a factor of student identifiers

`year` a numeric vector indicating the year of the test

`grade` a numeric vector indicating the student's grade

`math` a numeric vector of test scores on the IRT scale score metric

`retained` a factor with levels `0` `1` indicating if the student has been retained in a grade.

`female` a factor with levels `Female` `Male`

`black` a factor with levels `0` `1` indicating if the student is Black

`hispanic` a factor with levels `0` `1` indicating if the student is Hispanic

`size` a numeric vector indicating the number of students enrolled in the school

`lowinc` a numeric vector giving the percentage of low-income students in the school

`mobility` a numeric vector

Source

Reproduced from the`mlmRev` package for use in the section on nonresponse weighting in the `twang` package vignette. These data are distributed with the HLM software package (Bryk, Raudenbush, and Congdon, 1996). Conversion to the R format is described in Doran and Lockwood (2006).

References

Doran, H.C. and J.R. Lockwood (2006). "Fitting value-added models in R," *Journal of Educational and Behavioral Statistics*, 31(1)

`get.weights` *Extract propensity score weights*

Description

Extracts propensity score weights from a ps or mnps object.

Usage

```
get.weights(ps1,
stop.method = NULL,
            estimand = NULL,
            withSampW = TRUE)
```

Arguments

ps1	a ps or mnps object
stop.method	indicates which set of weights to retrieve from the ps object
estimand	indicates whether the weights are for the average treatment effect on the treated (ATT) or the average treatment effect on the population (ATE). By default, get.weights will use the estimand used to fit the ps object.
withSampW	Returns weights with sample weights multiplied in, if they were provided in the original ps or mnps call.

Details

Weights for ATT are 1 for the treatment cases and p/(1-p) for the control cases.

Weights for ATE are 1/p for the treatment cases and 1/(1-p) for the control cases.

Value

a vector of weights

ps

---

lalonde *Lalonde's National Supported Work Demonstration data*

Description

One of the datasets used by Dehejia and Wahba in their paper "Causal Effects in Non-Experimental Studies: Reevaluating the Evaluation of Training Programs." Also used as an example dataset in the MatchIt package.

Usage

```
data(lalonde)
```

Format

A data frame with 614 observations on the following 10 variables.

treat 1 if treated in the National Supported Work Demonstration, 0 if from the Current Population Survey

age age

educ years of education

black 1 if black, 0 otherwise

hispan 1 if Hispanic, 0 otherwise

`married` 1 if married, 0 otherwise

`nodegree` 1 if no degree, 0 otherwise

`re74` earnings in 1974 (pretreatment)

`re75` earnings in 1975 (pretreatment)

`re78` earnings in 1978 (outcome)

Source

lindner *Lindner Center data on 996 PCI patients analyzed by Kereiakes et al. (2000)*

Description

These data are adapted from the `lindner` dataset in the `USPS` package. The description comes from that package, except for the variable `sixMonthSurvive`, which is a recode of `lifepres`

Data from an observational study of 996 patients receiving an initial Percutaneous Coronary Intervention (PCI) at Ohio Heart Health, Christ Hospital, Cincinnati in 1997 and followed for at least 6 months by the staff of the Lindner Center. The patients thought to be more severely diseased were assigned to treatment with abciximab (an expensive, high-molecular-weight IIb/IIIa cascade blocker); in fact, only 298 (29.9 percent) of patients received usual-care-alone with their initial PCI.

Usage

```
data(lindner)
```

Format

A data frame of 10 variables collected on 996 patients; no NAs.

lifepres Mean life years preserved due to survival for at least 6 months following PCI; numeric value of either 11.4 or 0.

cardbill Cardiac related costs incurred within 6 months of patient's initial PCI; numeric value in 1998 dollars; costs were truncated by death for the 26 patients with lifepres == 0.

abcix Numeric treatment selection indicator; 0 implies usual PCI care alone; 1 implies usual PCI care deliberately augmented by either planned or rescue treatment with abciximab.

stent Coronary stent deployment; numeric, with 1 meaning YES and 0 meaning NO.

height Height in centimeters; numeric integer from 108 to 196.

female Female gender; numeric, with 1 meaning YES and 0 meaning NO.

diabetic Diabetes mellitus diagnosis; numeric, with 1 meaning YES and 0 meaning NO.

acutemi Acute myocardial infarction within the previous 7 days; numeric, with 1 meaning YES and 0 meaning NO.

ejecfrac Left ejection fraction; numeric value from 0 percent to 90 percent.

ves1proc Number of vessels involved in the patient's initial PCI procedure; numeric integer from 0 to 5.

sixMonthSurvive Survival at six months — a recoded version of `lifepres`.

`means.table` *Extract table of means from an mnps object*

Description

Extracts table of means from an mnps object.

Usage

```
means.table(mnps,
stop.method = 1,
            includeSD = FALSE, digits = NULL)
```

Arguments

`mnps`	An `mnps` object.
`stop.method`	Indicates which set of weights to retrieve from the `ps` object. Either the name of the stop.method used, or a natural number with 1, for example, indicating the first stop.method specified.
`includeSD`	Indicates whether standard deviations as well as means are to be displayed. By default, they are not displayed.
`digits`	If not `NULL`, results will be rounded to the specified number of digits.

Details

Displays a table with weighted and unweighted means and standardized effect sizes, and – if requested – standard deviations.

Value

A table of means, standardized effect sizes, and perhaps standard deviations, by treatment group.

See Also

mnps

---

mnps *Propensity score estimation*

Description

mnps calculates propensity scores and diagnoses them using a variety of methods, but centered on using boosted logistic regression as implemented in gbm

Usage

```
mnps(formula = formula(data),
   data,
   n.trees = 10000,
   interaction.depth = 3,
   shrinkage = 0.01,
   bag.fraction = 1.0,
   perm.test.iters=0,
   print.level = 2,
   iterlim = 1000,
   verbose = TRUE,
   estimand = "ATE",
   stop.method = "es.max",
   sampw = NULL,
   treatATT = NULL, ...)
```

Arguments

formula	A formula for the propensity score model with the treatment indicator on the left side of the formula and the potential confounding variables on the right side.
data	The dataset, includes treatment assignment as well as covariates
n.trees	number of gbm iterations passed on to gbm
interaction.depth	interaction.depth passed on to gbm
shrinkage	shrinkage passed on to gbm
bag.fraction	bag.fraction passed on to gbm

perm.test.iters
: a non-negative integer giving the number of iterations of the permutation test for the KS statistic. If perm.test.iters=0 then the function returns an analytic approximation to the p-value. Setting perm.test.iters=200 will yield precision to within 3% if the true p-value is 0.05. Use perm.test.iters=500 to be within 2%

print.level
: the amount of detail to print to the screen

iterlim
: maximum number of iterations for the direct optimization

verbose
: if TRUE, lots of information will be printed to monitor the the progress of the fitting

estimand
: The causal effect of interest. Options are "ATE" (average treatment effect), which attempts to estimate the change in the outcome if the treatment were applied to the entire population versus if the control were applied to the entire population, or "ATT" (average treatment effect on the treated) which attempts to estimate the analogous effect, averaging only over the treated population.

stop.method
: A method or methods of measuring and summarizing balance across pretreatment variables. Current options are ks.mean, ks.max, es.mean, and es.max. ks refers to the Kolmogorov-Smirnov statistic and es refers to standardized effect size. These are summarized across the pretreatment variables by either the maximum (.max) or the mean (.mean).

sampw
: Optional sampling weights.

treatATT
: If the estimand is specified to be ATT, this argument is used to specify which treatment condition is considered 'the treated'. It must be one of the levels of the treatment variable. It is ignored for ATE analyses.

...
: Additional arguments.

Details

formula should be something like "treatment ~ X1 + X2 + X3". The treatment variable should be a variable with three or more levels. There is no need to specify interaction terms in the formula. interaction.depth controls the level of interactions to allow in the propensity score model.

Note that — unlike earlier versions of twang — plotting functions are no longer included in the ps() function. See plot for details of the plots.

Value

Returns an object of class mnps, which consists of the following.

psList
: A list of ps objects.

nFits
: The number of calls to ps that were used to form the mnps object.

estimand
: The estimand – either ATT or ATE – that was specified in the call to mnps.

treatATT
: For ATT fits, the treatment category that is considered "the treated"

treatLev
: The levels of the treatment variable.

levExceptTreatAtt
: The levels of the treatment variable, excluding the treatATT level.

data	The data used to fit the model.
treatVar	The vector of treatment indicators
stopMethods	The stop.method vector specified in the call to mnps.
sampw	Sampling weights provided to mnps, if any.

plot.mnps *Plots for mnps objects*

Description

This function produces a collection of diagnostic plots for ps objects.

Usage

```
## S3 method for class 'mnps'
plot(x, plots = "optimize",
pairwiseMax = TRUE, figureRows = 1,
color = TRUE, subset = NULL, ...)
```

Arguments

x	An mnps object.
plots	An indicator of which type of plot is desired. The options are

"optimize" or 1 A plot of the balance criteria as a function of the GBM iteration

"boxplot" or 2 Boxplots of the propensity scores for the treatment and control cases

"es" or 3 Plots of the standardized effect size of the pre-treatment variables before and after reweighing

"t" or 4 Plots of the p-values from t-statistics comparing means of treated and control subjects for pretreatment variables, before and after weighting.

"ks" or 5 Plots of the p-values from Kolmogorov-Smirnov statistics comparing distributions of pretreatment variables of treated and control subjects, before and after weighting.

`pairwiseMax` If `FALSE`, the plots for the underlying `ps` fits will be returned. Otherwise, pairwise maxima will be returned.

`figureRows` The number of rows of figures that should be used.

`color` If `color = FALSE` figures will be gray scale.

`subset` Used to restrict which of the `stop.methods` will be used in the figure. For example `subset = c(1,3)` would indicate that the first and third `stop.methods` (in alphabetical order of those specified in the original call to `mnps`) should be included in the figure.

`...` Additional arguments that may be passed to the underlying `lattice` package plotting functions

Details

This function produces lattice-style graphics of diagnostic plots.

plot.ps *Plots for ps objects*

Description

This function produces a collection of diagnostic plots for ps objects.

Usage

```
## S3 method for class 'ps'
plot(x, plots = "optimize", subset=NULL, color = TRUE, ...)
```

Arguments

x	A ps object
plots	An indicator of which type of plot is desired. The options are **"optimize" or 1** A plot of the balance criteria as a function of the GBM iteration **"boxplot" or 2** Boxplots of the propensity scores for the treatment and control cases **"es" or 3** Plots of the standardized effect size of the pre-treatment variables before and after reweighing **"t" or 4** Plots of the p-values from t-statistics comparing means of treated and control subjects for pretreatment variables, before and after weighting. **"ks" or 5** Plots of the p-values from Kolmogorov-Smirnov statistics comparing distributions of pretreatment variables of treated and control subjects, before and after weighting. **"histogram" or 6** Histogram of weights for treated and control subjects.
subset	If multiple stop.method rules were used in the ps() call, subset restricts the plots of a subset of the stopping rules that were employed. This argument expects a subset of the integers from 1 to k, if k stop.methods were used.
color	If set to FALSE, grayscale figures will be produced
...	Additional arguments that may be passed to the underlying lattice package plotting functions

Details

This function produces lattice-style graphics of diagnostic plots.

print.dxwts *Print a diagnosis of the weights*

Description

Prints a diagnosis of the weights. Extracts summary.tab from the dx.wts object

Usage

```
## S3 method for class 'dxwts'
print(x, ...)
```

Arguments

x	a dx.wts object
...	further arguments passed to or from other methods

Value

See ps for a description of the components of the table

---

ps *Propensity score estimation*

Description

ps calculates propensity scores and diagnoses them using a variety of methods, but centered on using boosted logistic regression as implemented in gbm

Usage

```
ps(formula = formula(data),
   data,
   n.trees = 10000,
   interaction.depth = 3,
   shrinkage = 0.01,
   bag.fraction = 1.0,
   perm.test.iters=0,
   print.level = 2,
   iterlim = 1000,
   verbose = TRUE,
   estimand = "ATE",
   stop.method = c("ks.mean", "es.mean"),
   sampw = NULL,
   multinom = FALSE, ...)
```

Arguments

formula	A formula for the propensity score model with the treatment indicator on the left side of the formula and the potential confounding variables on the right side.
data	The dataset, includes treatment assignment as well as covariates
n.trees	number of gbm iterations passed on to gbm

`interaction.depth`
: `interaction.depth` passed on to `gbm`

`shrinkage`
: `shrinkage` passed on to `gbm`

`bag.fraction`
: `bag.fraction` passed on to `gbm`

`perm.test.iters`
: a non-negative integer giving the number of iterations of the permutation test for the KS statistic. If `perm.test.iters=0` then the function returns an analytic approximation to the p-value. Setting `perm.test.iters=200` will yield precision to within 3% if the true p-value is 0.05. Use `perm.test.iters=500` to be within 2%

`print.level`
: the amount of detail to print to the screen

`iterlim`
: maximum number of iterations for the direct optimization

`verbose`
: if TRUE, lots of information will be printed to monitor the the progress of the fitting

`estimand`
: The causal effect of interest. Options are `"ATE"` (average treatment effect), which attempts to estimate the change in the outcome if the treatment were applied to the entire population versus if the control were applied to the entire population, or `"ATT"` (average treatment effect on the treated) which attempts to estimate the analogous effect, averaging only over the treated population.

`stop.method`
: A method or methods of measuring and summarizing balance across pretreatment variables. Current options are `ks.mean`, `ks.max`, `es.mean`, and `es.max`. `ks` refers to the Kolmogorov-Smirnov statistic and `es` refers to standardized effect size. These are summarized across the pretreatment variables by either the maximum (`.max`) or the mean (`.mean`).

`sampw`
: Optional sampling weights.

`multinom`
: Set to true only when called from `mnps` function.

`...`
: Additional arguments.

Details

`formula` should be something like "treatment ~ X1 + X2 + X3". The treatment variable should be a 0/1 indicator. There is no need to specify interaction terms in the formula. `interaction.depth` controls the level of interactions to allow in the propensity score model.

Note that — unlike earlier versions of `twang` — plotting functions are no longer included in the `ps()` function. See `plot` for details of the plots.

Value

Returns an object of class `ps`, a list containing

`gbm.obj`
: The returned `gbm` object

`treat`
: The treatment variable.

`desc`
: a list containing balance tables for each method selected in `stop.methods`. Includes a component for the unweighted analysis names “unw”. Each `desc` component includes a list with the following components

ess The effective sample size of the control group

n.treat The number of subjects in the treatment group

n.ctrl The number of subjects in the control group

max.es The largest effect size across the covariates

mean.es The mean absolute effect size

max.ks The largest KS statistic across the covariates

mean.ks The average KS statistic across the covariates

bal.tab a (potentially large) table summarizing the quality of the weights for equalizing the distribution of features across the two groups. This table is best extracted using the `bal.table` method. See the help for `bal.table` for details on the table's contents

n.trees The estimated optimal number of `gbm` iterations to optimize the loss function for the associated `stop.methods`

ps a data frame containing the estimated propensity scores. Each column is associated with one of the methods selected in `stop.methods`

w a data frame containing the propensity score weights. Each column is associated with one of the methods selected in `stop.methods`. If sampling weights are given then these are incorporated into these weights.

estimand The estimand of interest (ATT or ATE).

`datestamp` Records the date of the analysis

`parameters` Saves the `ps` call

`alerts` Text containing any warnings accumulated during the estimation

`iters` A sequence of iterations used in the GBM fits used by `plot` function.

`balance` The balance measures for the pretreatment covariates, with a column for each `stop.method`.

`n.trees` Maximum number of trees considered in GBM fit.

`data` Data as specified in the `data` argument.

`gbm`

raceprofiling *Traffic stop data*

Description

Simulated example data for assessing race bias in traffic stop outcomes

Usage

```
data(raceprofiling)
```

Format

A data frame with 5000 observations on the following 10 variables.

`id` an ID for each traffic stop

`nhood` a factor indicating the neighborhood in which the stop occurred.

`reason` The reason for the stop, mechanical/registration violations, dangerous moving violation, non-dangerous moving violation

`resident` an indicator whether the driver is a resident of the city

`age` driver's age

`male` an indicator whether the driver was male

`race` the race of the driver, with levels `A`, `B`, `H`, `W`

`hour` the hour of the stop (24-hour clock)

`month` and ordered factor indicating in which month the stop took place

`citation` an indicator of whether the driver received a citation

Source

This is simulated data to demonstrate how to use `twang` to adjust estimates of racial bias for important factors. This dataset does not represent real data from any real law enforcement agency.

Examples

```
data(raceprofiling)

# the first five lines of the dataset
raceprofiling[1:5,]
```

stop.methods *Object only used for backward compatibility*

Description

In older versions of twang, the ps function specified the stop.method in a different manner. This stop.methods object is used to ensure backward compatibility; new twang users should not make use of it.

Details

This is merely a vector with the names of the stopping rules.

ps

summary.mnps *Summarize an mnps object*

Description

Computes summary information about a stored mnps object

Usage

```
## S3 method for class 'mnps'
summary(object, ...)
```

Arguments

object	a ps object
...	additional arguments affecting the summary produced

Details

Compresses the information in the desc component of the ps object into a short summary table describing the size of the dataset and the quality of the propensity score weights.

Value

See ps for details on the returned table

summary.ps *Summarize a ps object*

Description

Computes summary information about a stored ps object

Usage

```
## S3 method for class 'ps'
summary(object, ...)
```

Arguments

object	a ps object
...	additional arguments affecting the summary produced

Details

Compresses the information in the desc component of the ps object into a short summary table describing the size of the dataset and the quality of the propensity score weights.

Value

See ps for details on the returned table
